Heavy-duty rod ends Selection

Heavy-duty rod ends are robust, maintenance-free or low-maintenance bearing elements which, considering the selection criteria described hereafter, impress because of their outstanding working lifes.

Heavy-duty rod ends with integral self-aligning ball bearing, series BRM, BRF, PM, PF

This design is especially suitable for high speeds, large swivelling angles or rotating movements with relatively low or medium loads. Prominent technical features are the low bearing friction, long-term greasing as well as the sealing against rough dirt penetration by means of shields on both sides. Under normal operating conditions the rod ends are maintenance-free. Lubrication fittings are provided for lubrication in case of rough operations and maximum loads. To avoid incompatibility with the production lubrication, we recommend lubrication with a aluminium-complex-soap-grease. A special heat treatment procedure confers the rod end housing a raceway hardness adapted to the antifriction bearing, ensuring at the same time high stability with changing loads.

Heavy-duty rod ends with integral self-aligning roller bearings, series BRTM, BRTF

The design based on the structure of a self-aligning roller bearing is preferably used for high speed, wide tilting angles or rotating movements under high loads. Compared to rod ends with self-aligning ball bearings, rod ends with self-aligning roller bearings have essentially higher basic load ratings. This design is equipped with a cage to minimize the rolling friction and heat built-up. These rod ends with long-term lubrication are maintenance-free under normal operating conditions. Lubrication fittings are provided for lubrication in case of rough operations and maximum loads.

To avoid incompatibility with the production lubrication, we recommend lubricating with an aluminium-complex-soap-grease. Shields on both sides prevent dirt particles from penetrating into the bearing. The rod ends with self-aligning roller bearings are, just as the design with self-aligning ball bearings,

subjected to a special heat treatment to obtain a raceway hardness adapted to the antifriction bearings, ensuring at the same time a high stability with changing loads.

Heavy-duty rod ends with integral maintenance-free spherical plain bearings, series BEM, BEF, EM, EF

In many cases heavy-duty rod ends with integrated spherical plain bearings serve their purpose. They are above all used for small swivelling or tilting movements at low speeds. They stand out for their high loadability and can also be used for shock-like loads. The rod end ball slides on a bearing shell consisting of a glass fibre-filled nylon/teflon compound. This design ensures an absolutely maintenance-free rod end. Heavy-duty plain bearing rod ends have a slight initial stress and virtually no clearance. The compound used has the favourable secondary advantage to absorb any foreign particles and to enclose them that no damage may occur. The joint balls of heavy-duty rod ends with integrated spherical plain bearing are standardly fitted with a hard chrome plating. This reliable corrosion protection ensures that the function of the rod end will not be affected by a corroded ball surface under humid operating conditions.

Basic load ratings

Static basic load rating of antifriction bearing rod ends

The static basic load rating C_0 of an antifriction bearing rod end corresponds to that of a static radial load causing a lasting overall deformation of 1/10.000 of the roller body diameter at the contact point most highly stressed between roller body and raceway.

Static basic load ratings of plain bearing rod ends

The static basic load rating C_0 of a plain bearing rod end corresponds to the static radial load that does not yet cause a lasting deformation at the weakest housing section. It contains at least a 1.2 fold security compared to the yield stress of the material used for the rod end housing.

Dynamic basic load rating of anti-friction bearing rod ends

The dynamic basic load rating C of an anti-friction bearing rod end is the external radial load, unchangeable in size and direction, at which 90 % of a large quantity of obviously identical rod ends will reach or exceed 1 million of rotations or swivelling movements.

Dynamic basic load ratings of plain bearing rod ends

The dynamic basic load rating C is the parameter for the calculation of dynamically loaded maintenance-free heavy-duty rod ends with integrated spherical plain bearing, in other words, making tilting, swivelling or rotating movements under load.

Basic load ratings always depend on the definitions they are based on. For this reason it is not always possible to compare basic load rating data supplied by different manufacturers.

Operating temperatures

Heavy-duty antifriction bearing rod ends can be used for operating temperatures between -45°C and $+120^{\circ}\text{C}$.

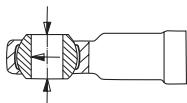

The temperature range of heavy-duty rod ends with integrated spherical plain bearings is between -30°C and $+60^{\circ}\text{C}$, without affecting the loadability. Higher temperatures will reduce the loadability taken into account for the calculation of the working life under the temperature factor C_2 .

Loads

The decisive parameters for the selection and calculation of heavy-duty rod ends are size, direction and type of load.

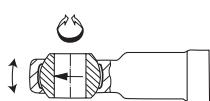

Radial or combined loads

The heavy-duty rod ends have been especially designed to adopt high radial loads. They can furthermore be used for combined loads. The axial load share of which does not exceed 20 % of the corresponding radial load.

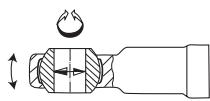

Unilaterally acting load

In this case the load acts only in the same direction, which means that the load area is always in the same bearing section.

Alternately acting load

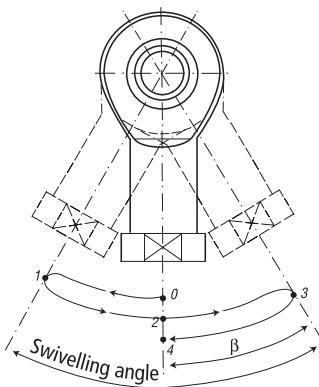

In case of alternating loads, the load areas facing each other are alternately loaded and/or relieved, which means that the load changes its direction constantly by approx. 180° .

Swivelling angle

The swivelling angle is the excursion of the rod end from one final position to the other.

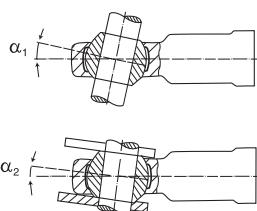

Half the swivelling angle β is used to calculate the service or working life.

Angle of tilt

The angle of tilt, also called setting angle, refers to the possible excursion of the joint ball and/or the inner ring to the rod end axis in degrees. The tilting angle α indicated in the table for the heavy-duty antifriction bearing rod ends corresponds to the max. possible excursion being limited by the shields on both sides. It is important that this tilting angle is not exceeded either during installation or operation, as otherwise the shields may be damaged. As far as heavy-duty plain bearing rod ends are concerned, distinction is made between the tilting angles α_1 and α_2 .

If the excursion is not limited by adjacent components, excursion angle α_1 can fully be used without affecting the rod end capacity. Tilting angle α_2 is the excursion limit when connecting a forked component.

Nominal service life

The term »nominal service life« is used for heavy-duty antifriction bearing rod ends and represents the number of swivelling motions or rotations and/or the number of service hours the rod end performs before showing the first signs of material fatigue at the raceway or roller bodies. In view of many influence factors that are difficult or

impossible to assess, the service life of several obviously identical bearings differ under the same operating conditions. For this reason, the following method for the service life determination of heavy-duty antifriction rod ends results in a nominal service life being achieved or exceeded by at least 90 % of a larger quantity of identical rod ends.

Working life

The term »working life« is used with heavy-duty plain bearing rod ends. It represents the number of swivelling motions or rotations and/or the number of service hours the heavy-duty plain bearing rod end performs before becoming unserviceable because of material fatigue, wear, increased bearing clearance or increase of the bearing friction moment. The working life is not only influenced by the size and the type of load, it is also affected by a number of factors, which are partially difficult to assess. A calculation of the exact servicelife is therefore impossible. Fieldexperienced standard values for the approximate working life can nevertheless be determined by using the following calculation procedure which is based on numerous results from endurance test runs and values from decades of experience. The values determined by this formula are achieved, normally even exceeded, by the majority of the heavy-duty rod ends.

The specific loading of rod ends and bearings differs in each application. Therefore general statements by a producer in a catalogue may not totally fit to the single application.

In all cases the user has to coordinate the theoretical selection criteria with the concrete installation situation and check the suitability of the rod end respectively bearing. In this context the user has to define sufficient security factors and maintenance intervals.

Heavy-duty rod ends

Calculations

Antifriction bearing construction

Heavy-duty rod ends with integral self-aligning ball bearing series BRM, BRF, PM, PF

Nominal service life

$$\text{rotating: } L_{h_{\text{rot.}}} = 10^6 \frac{\left(\frac{C}{P}\right)^3}{60 \cdot n} \quad [h] \quad (1)$$

oscillating:

$$L_{h_{\text{osz.}}} = 10^6 \frac{\left(\frac{C}{P} \sqrt[3]{\frac{\beta}{90}}\right)^3}{60 \cdot f} \quad [h] \quad (2)$$

condition:

swivelling angle $\beta \geq 3^\circ$
For swivelling angles $\beta \geq 3^\circ$
we recommend the use of
heavy-duty plain bearing
rod ends.

Static load

$$\text{constant: } P_o \leq C_o \quad [N] \quad (3)$$

Heavy-duty rod ends with integral self-aligning roller bearing series BRTF, BRTM

Nominal service life

$$\text{rotating: } L_{h_{\text{rot.}}} = 10^6 \frac{\left(\frac{C}{P}\right)^{3,333}}{60 \cdot n} \quad [h] \quad (4)$$

oscillating:

$$L_{h_{\text{osz.}}} = 10^6 \frac{\left(\frac{C}{P} \sqrt[3]{\frac{\beta}{90}}\right)^{3,333}}{60 \cdot f} \quad [h] \quad (5)$$

condition:

swivelling angle $\beta \geq 3^\circ$
For swivelling angles $\beta \geq 3^\circ$
we recommend the use of
heavy-duty plain bearing
rod ends.

Static load

$$\text{constant: } P_o \leq C_o \quad [N] \quad (6)$$

Heavy-duty rod ends Calculations

80°C to 100°C	0,7
100°C to 110°C	0,6

Material factor C_3

Alignment chart for material factor C_3

Factor for type of load C_4

Static load

If heavy-duty rod ends support loads whilst stationary or with very little movement, the maximum permissible load is not a result of wear but a function of the material strength of the sliding layer or the rod end housing.

If static loads are a combination of radial and axial loads, the equivalent static bearing load will have to be calculated.

The Calculation is identical with that of the equivalent dynamic bearing load – see equation (13), page 8.

Permissible sliding velocity

The permissible sliding velocity of heavy-duty rod ends depends mainly on the load and temperature conditions. Heat generated through friction in the rod end housing itself is the main limitation on sliding velocity. When selecting the rod end size, it is necessary to determine the sliding velocity and the pv -value, which is a product of the specific bearing load p [N/mm^2] and the sliding velocity v [m/s].

The following standard values refer to swivelling and rotating movements. With satisfactory cooling, speeds may be increased.

Permissible

$$pv\text{-value} = 0,5 \text{ N/mm}^2 \cdot \text{m/s}$$

Permissible sliding velocity

$$v_{\text{max.}} = 0,15 \text{ m/s} \geq v_m$$

Heavy-duty rod ends

Calculations

Specific bearing load

$$p = k \cdot \frac{P}{C} \quad (15)$$

p specific bearing load [N/mm²]

P equivalent dynamic load [N], see equation (13), page 8

C basic dynamic load rating [N], see tables

k specific load factor [N/mm²] for sliding contact surfaces steel on nylon/teflon/fibre glass

$$k = 50 \text{ N/mm}^2$$

Mean sliding velocity

$$V_m = 5,82 \cdot 10^{-7} \cdot d_8 \cdot \beta \cdot f \quad (16)$$

V_m mean sliding velocity [m/s]

d₈ joint ball diameter [mm], see tables

β half the swivelling angle [degrees], β = 90° should be used for rotation

f frequency of oscillation [min⁻¹]

Calculation example

The rod assembly of a conveyor equipment calls for a heavy-duty rod end with a working life of 7000 hours in conjunction with an alternating acting load of 5000 N. 25 swivelling movements with a swivelling angle of 20° take place per minute. The operating temperature amounts to approx. 60°C. The choice is a heavy-duty rod end EF 15 with:

$$C = 13400 \text{ N}, d_8 = 22 \text{ mm}.$$

Working life

$$G_h = c_1 \cdot c_2 \cdot c_3 \cdot \frac{5}{d_8 \cdot \beta \cdot f} \cdot \frac{C}{P} \cdot 10^6$$

$$c_1 = 0,25 \text{ (alternating load direction, } f = 25 \text{ min}^{-1} < 30 \text{ min}^{-1})$$

$$c_2 = 1,0 \text{ (operating temperature } 60^\circ \text{ C)}$$

$$c_3 = c_2 \cdot \frac{C}{P} = 1,0 \cdot \frac{13400}{5000} = 2,68$$

see alignment chart page 8 C₃ = 17

$$d_8 = 22 \text{ mm}$$

$$f = 25 \text{ min}^{-1}$$

$$\beta = 10^\circ \text{ (half the swivelling angle: } 20^\circ : 2 = 10^\circ)$$

$$C = 13400 \text{ N}$$

$$P = 5000 \text{ N}$$

$$G_h = 0,25 \cdot 1,0 \cdot 12 \cdot \frac{5}{22 \cdot 10 \cdot 25} \cdot \frac{13400}{5000} \cdot 10^6$$

$$= \underline{\underline{7308 \text{ h} > 7000 \text{ h}}}$$

Checking the permissible load of the rod end

$$P_{max} = C_o \cdot c_2 \cdot c_4$$

$$C_o = 41000 \text{ N}$$

$$c_2 = 1,0 \text{ (operating temperature } 60^\circ \text{ C)}$$

$$c_4 = 0,2 \text{ (alternating load)}$$

$$P_{max} = \underline{\underline{41000 \cdot 1,0 \cdot 0,2 = 8200 \text{ N} > 5000 \text{ N}}}$$

Checking the permissible sliding velocity

$$V_m = 5,82 \cdot 10^{-7} \cdot d_8 \cdot \beta \cdot f = 5,82 \cdot 10^{-7} \cdot 22 \cdot 10 \cdot 25$$

$$= \underline{\underline{0,0032 \text{ m/s} < 0,15 \text{ m/s}}}$$

Checking the p · v -value

$$p = k \cdot \frac{P}{C} = 50 \cdot \frac{5000}{13400} = 18,66 \text{ N/mm}^2$$

$$p \cdot V_m = 18,66 \cdot 0,0032$$

$$= \underline{\underline{0,06 \text{ N/mm}^2 \cdot \text{m/s} < 0,5 \text{ N/mm}^2 \cdot \text{m/s}}}$$

Heavy-duty rod ends with integral self-aligning ball bearing

rod end housing:

forged steel, case-hardened bearing race, superfinished, rolled thread, surface galvanized, free of Cr VI

inner ring:

ball bearing steel, hardened, superfinished

lubrication:

aluminium-complex-soap-grease, temperature range -45 °C to +120 °C, approval according to USDA H1

lubrication fitting:

DIN 3405 D1/A (sizes 6 to 10)
DIN 71 412 H1 (sizes 12 to 30)

bearing clearance:

10 - 30 µm radial

tolerances:

see page 10

threaded bolt & rod linkage Mountings

Threaded Bolt

In addition to the heavy-duty rod ends series K Nadella supplies a threaded bolt. The bolt can be supplied already fixed to the required rod end.

order number type size		measurements [mm]					SW	weight [g/bolt]
		L	L ₁	L ₂	G	D		
BOK	06	18,5	13	10	M 6	9,0	8	10
BOK	08	23,5	17	13	M 8	10,5	8	12
BOK	10	28,0	21	17	M 10	13,0	12	25
BOK	12	32,5	25	20	M 12	15,0	14	40
BOK	14	37,5	29	22	M 14	17,0	14	65
BOK	16	42,5	33	24	M 16	19,0	17	90

When ordering this constellation please use the catalogue designation of the required rod end along with the type of the fitting threaded bolt.

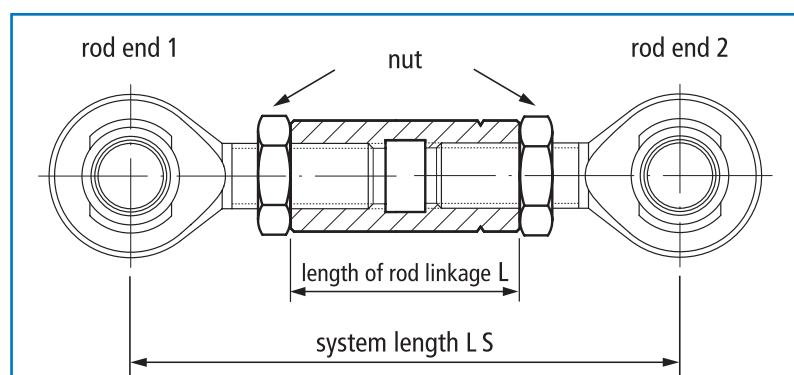

Example: you need a integral spherical plain bearing BEM 10 incl. threaded bolt:

text of order: **BEM 10-20-501 + BOK 10**

Rod Linkage

To simplify installation you can use already mounted rod linkages.

Please define the desired system as described in the table below:

Heavy duty rod end 1	length of rod linkage L	system length LS	Heavy duty rod end 2

Upon your request you will receive the rod linkage with male thread respectively pipe construction to reduce weight.

DIN ISO-rod ends & DIN ISO-rod bearing
