

Die sets made of steel and aluminium

- In standardized sizes from stock or in any forms and dimensions to your drawings.
- Die sets stress-relieved, surfaces polished plane parallel. Ruptures, recesses, boreholes to your instructions.
- Sliding guides with guide bushes of hardened steel with bronze-plated treat as well as
- Ball guides, roller guides
- Precision die sets for progressive and compound dies
- Steel plates for die sets
- Centering and damping units

Die sets ST 35..

without stripper plate

Rectangular working area
2 or 4 pillars

Material: 1.0570 (St 52.3) aluminium on request

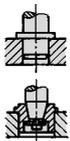

The plates are cleanly flame cut and normalized. Upon request edges finished. Please state on order.

Position of bushings:
Normally the positions of bushings will be as shown. If different positions are required indicate this on the order.

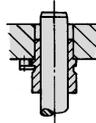

DIN 9868

Different Guide pillars length on request

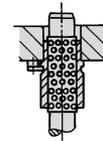

Lifting devices see under accessories

Removable pillars
upon request

Acceptance specifications

for die sets made of steel and aluminium

similar to DIN 9811 part 1

Sizes without tolerances
for machined surfaces: DIN 7168 – middle

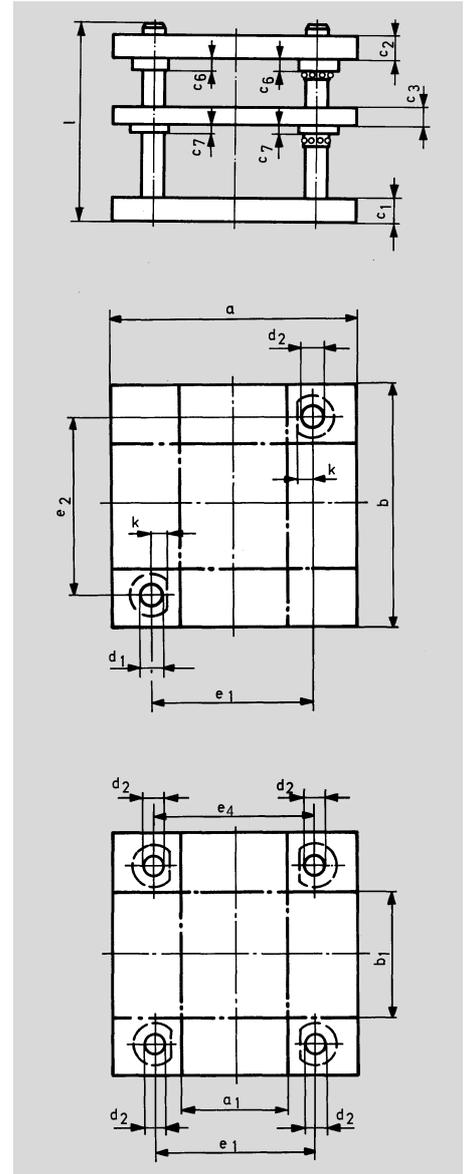

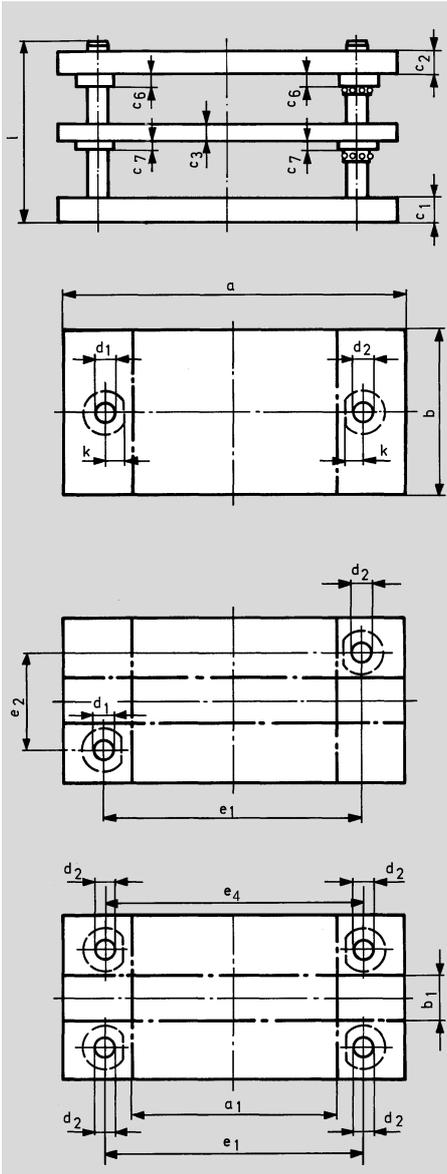

Tolerances of flatness, parallelism and squareness

	Test specimen	Testing position	Max. overall length of working surface l		Tolerances T_p, T_E, T_R
			over	to	
Flatness of surface			—	—	0,005 per 100 mm length of working surface *)
Parallelism of working surfaces			0	100	0,005
			100	200	0,008
			200	300	0,011
			300	400	0,014
			400	500	0,017
			500	600	0,020
Parallelism of contact surfaces			0	100	0,008
			100	200	0,012
			200	300	0,018
			300	400	0,024
			400	500	0,030
			500	600	0,036
Squareness of guide pillars			—	—	0,005 per 100 mm length of pillars *)

*) When testing larger or smaller lengths, multiply tolerance value accordingly with the relevant factor.

Stamping Block ST 3730

There is still a single tool available for the manufacture of metal parts from strip or coiled material. In order to achieve a simplified tool construction and shorten the delivery-time, it is practical to use prefabricated tooling components. This is the reason that STEINEL NORMALIEN offers stamping blocks in several standard sizes to manufacture simple stamped parts.

The stamping blocks are manufactured to the well known STEINEL precision. All plates are ground with square angles on 4 sides, so they can be used as reference edges.

The set edges, depending on their size, are 50 – 100 mm longer than the die block and are provided with a cross plate.

The punch holder is the same width as the stamping block lower plate, which offers an optimal use of the work area.

The plate dimensions are according to DIN and ISO standards, as stated in our catalogue.

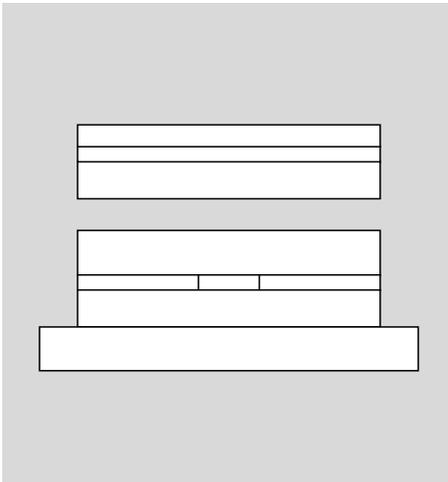

Tip: STEINEL-stamping blocks can also be made to your specifications, such as with radius corner set edges, tapped holes for clamping, etc.

Order example: Stamping block complete **ST 3730**

Stamping block size a x b = 196 x 96

Add **196 x 096**

Order number **ST 3730.196 x 096**

Ground parallel:

Plate length until 250 mm ± 0,015 mm
Plate length until 400 mm ± 0,025 mm

Tolerances:

Plate size – 0,2 mm
Plate thickness – 0,2 mm

Screws in die block:

until 246 mm length = 4 screws
from 311 mm length = 6 screws

Screws in punch holder:

until 246 mm length, 1-piece punch back-up plate = 4 screws
from 311 mm length, 1-piece punch back-up plate = 8 screws
from 396 mm length, 2-piece punch back-up plate = 8 screws

Die sets ST 3712, ST 3719

for progressive and compound tools

STEINEL[®]
NORMALIEN

Progressive and compound tools size: 1

Materials: plates ① and ② 1.2842 (90 Mn Cr V 8). All other plates 1.0570 (St 52-3).

Soft pressure plate: upon request can also be delivered hardened. (Please indicate on your order. "With hardened pressure plate").

For segmentation: Precision steel plate on request.

Tip: Steinel also delivers special design column mounts to fit your requirements. The plate sizes correspond to DIN/ISO standards, as they are listed in our catalog.

The column mounts are constructed according to the mechanical assembly technique and are guaranteed to offer an economical application to our clients.

You can use our bearing mounting spring units as your spring system. You have the choice among four different load bearing types (SZ 8565).

These columns can be weighted more than standard columns by a factor of eight since the central mounting of the columns in the guide plate reduces the length of the stress application point by half in the upper and lower part of the tool.

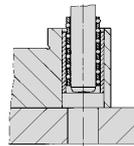

Sliding guides: can be connected with central lubrication (M 8 x 1).

Order example: Column mount for progressive and compound tools with bronze plated steel sliding guide **ST 3719**.

Steel plates ST 3500

for die sets

STEINEL[®]
NORMALIEN

DIN 9873, ISO 6753

Material: 1.0570 (St. 52.3), other materials for example super heat treated or aluminium 3.4365.71 (Al Zn Mg Cu 1.5) are available upon request. All cleanly flame-cut sizes and normalized, both sides plane-parallel machined to max. 2000 x 800 mm ground. Please state on order.

Larger steel plates can be manufactured short-dated according to your instructions within the max. size of 2000 x 1000 mm and thickness of 20 to 150 mm in each size and form.

Order example: steel plate **ST 3500**

Steel plate ST 3502

Machined type

DIN 9873

Material: 1.0570 (ST 52-3)

The plane parallel plates are uniformly finished, spot-facing is at right angles. Other dimensions or materials are available upon demand.

Tip: These plates are particularly well suited for the inner area of punching tools as well as for die sets.

Order example: Steel plate **ST 3502**

Size a x b x c = 246 x 156 x 32

Add **246 x 156 x 32**

Die sets made of steel and aluminium according to drawing

Steinel steel or aluminium columnar frames can be rapidly manufactured according to your specifications or drawings in any desired dimensions or forms within the maximal production limits.

Plate machining

Burned or machine clean on all sides, heated tension-free, polish plano-parallel up to a maximum of:

2000 x 800 mm

Larger plates finally milled up to:

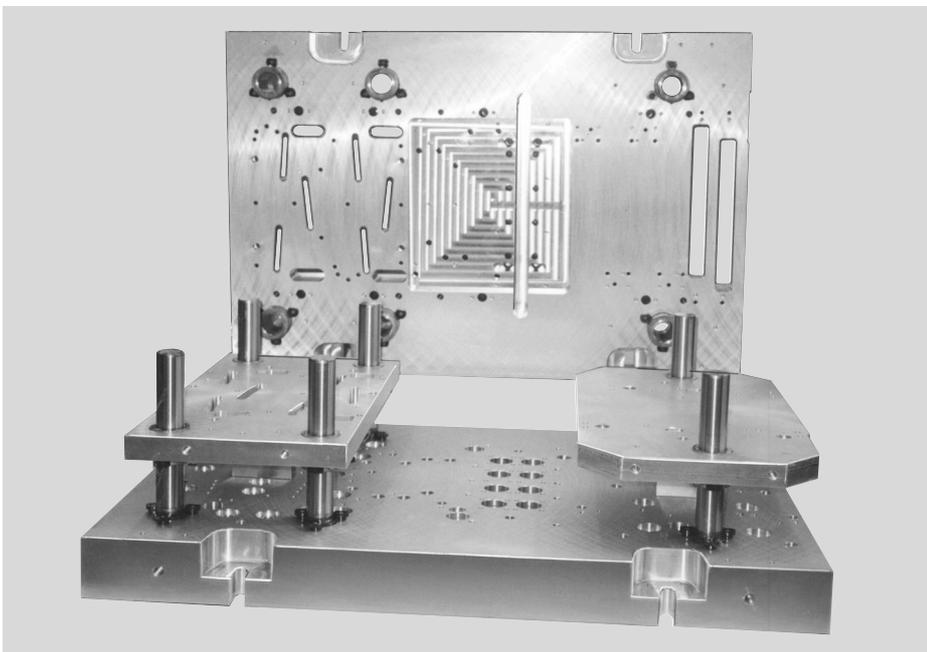

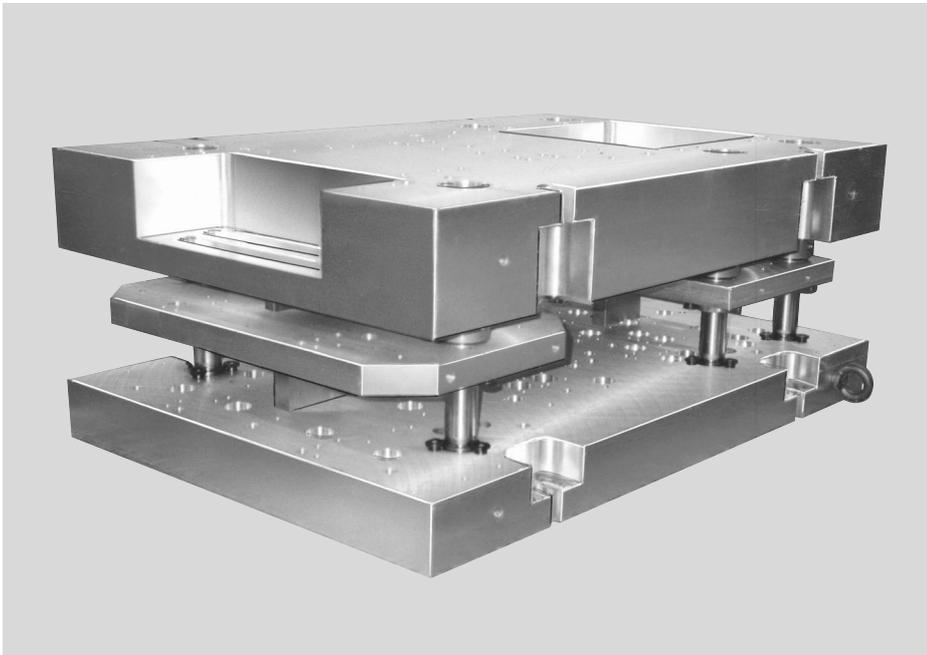

2500 x 1250 mm

Plate thicknesses up to: **20 – 250 mm.**

Further dimensions available on request.

Machining services

Breakthroughs, countersinks, hollowing, drilling patterns, coordinate grinding, eroding etc. can be done according to your specifications or sketches.

Die sets made of special grey cast iron

- In numerous standard sizes on stock
- Die sets made of special grey cast iron GGI, alloy (best cutting property) and ultrasonically tested, accordingly without shrinkage, cavities, cracks or inclusions.
- Sliding guides directly in the grey cast iron or guide bushes made of hardened steel with bronze plated running surface.
- Ball guides
- Roller guides

Steinel precision sliding guides with solid lubricant

Fields of application

Steinel precision sliding guides with "solid lubricant" can be used for tool and fixture manufacturing in various fitting positions for longitudinal motions.

Structure

The Steinel precision sliding guide "with solid lubricant" is composed of:
Guide pillar and die set upper plate made of grey cast iron of special type resp. guide bearing with built-in solid lubricant bushes.

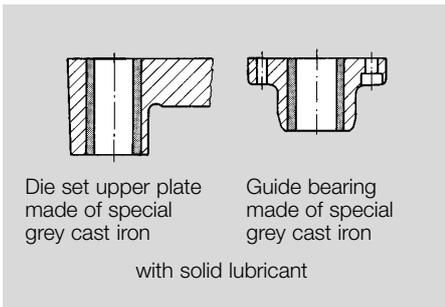

Material:

Steel with lubricant cups

These sliding guides are self-lubricating due to the presence of built in lubrication cups, thereby also increasing their pressure tolerance.

Our maintenance-free, self-lubricating bearing bush is complex and highly wear resistant. It has embedded in it various lubricating materials such as molybdenum, disulfate and graphite in appropriate form.

It thereby differs from other sinter bearing bushes, which are commonly considered oil-free bearings.

Lubrication with solid lubricant

The lubrication with solid lubricant is designated as state of lubrication where solid lubricant particles having a low cutting resistance in their crystalline structure exist between two surfaces and their adopt the lubrication function.

Sliding speed

The max. sliding speed is at 30 m / min.

With ideal lubrication, ideal guide clearance and length of stroke, ideal radial load and heat dissipation the Steinel precision sliding guide "with solid lubricant" allows stroke speeds of 600 – 800 strokes/min.

Guide clearance

The guide clearance is 2 – 7 µm. If you require more clearance, please specify in your order f.e. "Honed for easy slide fit".

Advantages:

In the automatic systems you avoid corrodors which can arise due to a lack of maintenance.

The maintenance is generally eased because there is simply no longer a lubrication required.

Safety and cleanliness in the environment of production are essentially increased as there is no lubrication made any more.

Reduction of the number of required parts on the devices due to the discontinuance of the central lubrication systems whereby the costs for mounting resp. assembling are reduced.

You can save time already during constructions when you no longer require the lubricating system.

Hints for installation:

1st Glue into fixing bore hole ISO H6
(see to conc. page for bonding agent)

2nd Avoid to press in lest inner diameter becomes more narrow.

Guidance diameter ISO H6 precision turned
Fixing bore hole ISO j6 precision turned.

Guide units

- Guide units for tools, instruments and machinery
- Guide pillars according to ISO, DIN, Steinel norm or your drawings
- Quick change guide pillars
- Pillar bearings
- Guide bushes made of hardened steel bronze-plated, for exceptionally high stress
- Guide bushes made of solid bronze with solid lubrication inserts
- Ball guide bushes and ball cages for radial and axial movement
- Roller cages for axial movement
- Guide plates with solid lubrication inserts

Guide bushings DIN 9831/ISO 9448

New: Standardized outside diameter
Advantage: Reciprocal interchangeability

Steel sliding guide bronze plated

ST 7409 ST 7419 ST 7429

Interchangeability of all guide bushings

For each bore, you can use:
Two different inside diameters, for example 30/32
Seven different types of guidance, for example: three sliding guide and four ball guide types
Three different bushing types, for example: shoulder, flange or smooth bushings
Three different bushing lengths (for inside diameters from 19 to 80)

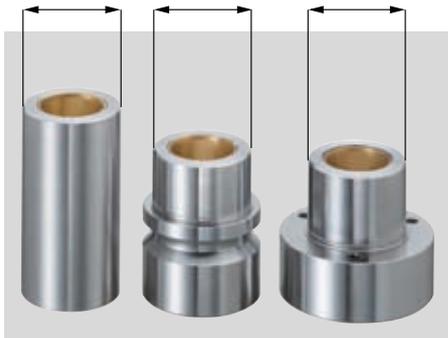

Therefore, it is possible to use $2 \times 7 \times 3 \times 3 = 126$ different guide bushings for each bore.

Roller guide

ST 7403 ST 7413 ST 7423

Ball guide plastic

ST 7405 ST 7415 ST 7425

Fields of Application:

Steinel precision guide units can be utilized in the manufacture of tools, fixtures, machines, measuring instruments, medical devices and automobiles. They are characterized by their high load capacity and resistance to wear.

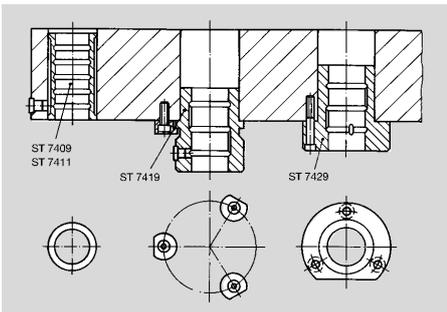

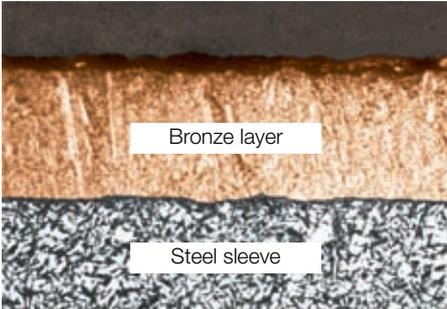

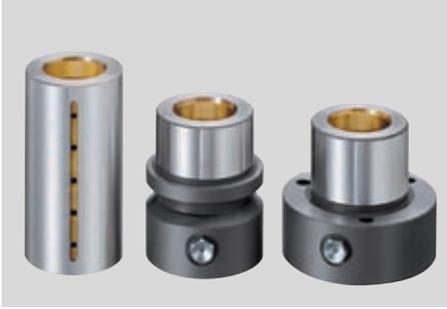

Advantages:

Due to the standardized outside diameter, all guide bushings are interchangeable. A die set with a sliding guide can be changed to using a ball or roller guide without any additional work, simply by exchanging the guide bushings.

Steinel precision sliding guides

steel bronze plated or with solid lubricant

Steel sliding guide bronze plated

The guide bushings ST 7419 and ST 7429 have an M 8 x 1 threaded hole that enables them to be connected to a central lubrication system.

Fields of application

Steinel precision sliding guides "steel bronze plated" or with "solid lubricant" are used for longitudinal motion in the manufacture of tools, fixtures, machines, medical devices and automobiles. They are characterized by their high load capacity and resistance to wear.

Component arrangement

The Steinel precision sliding guide "steel bronze plated" or with "solid lubricant" is composed of a guide pillar and guide bushing with honed clearance.

Bronze plating

The hardened steel sleeve absorbs strong lateral forces and prevents the guide bushing from deforming when it is being compressed strongly across its edges.

The galvanized bronze plating is very hard, wear-resistant and honed to highest surface finish quality. In addition to its excellent long running wear factor it also has very good heat dissipation characteristics that ensures the rapid dispersion of excessive frictional heat.

Lubrication

All Steinel precision sliding guides "steel bronze plated" are supplied with an internal lubrication system, where the parallel lubrication rills across the grooves are connected with axial channels. As a result, an equal distance to all lubrication points is ensured. At the same time, the internal lubrication system guarantees a shielding effect against dirt. The internal lubrication system must be supplied with high-quality oil or high-quality grease several times a day, depending on sliding speed.

Sliding speed

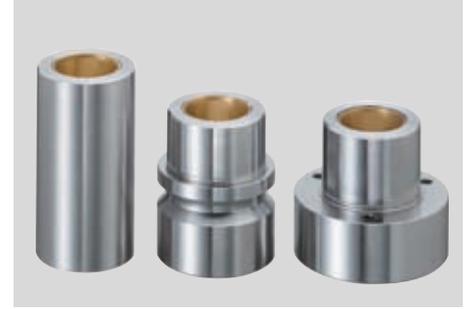

The recommended sliding speed is 15 – 30 m/min.

Under ideal conditions of lubrication, guide clearance, stroke length, radial load and heat dissipation, very high stroke speeds of 600 – 800 strokes/min. can be achieved with the Steinel precision sliding guide "steel bronze plated".

Guide clearance

The guide bushings are precision turned and honed. An additional compression of the sliding surface takes place at the tool start-up, resulting in better sliding characteristics. The clearance is 2 – 7 µm. If more clearance is required, please indicate it on the order as "honed for easy slide fit".

Sliding guide with solid lubricant

Maintenance-free guide bushings

As a result of the moving parts, the solid lubricant produces a tightly clinging, consistent lubrication film between the guiding elements. This film also adheres to the surfaces when the parts are not moving or when they first start moving, which prevents corrosion between the guide bushing and guide pillar. Our lubricant and maintenance-free guide bushings are complex, highly wear-resistant slide elements of the highest precision. Even after long continual use, our guide bushings do not undergo any deformation due to the long-enduring strength of the fundamental materials.

Lubrication

The solid lubricant construction, the particles of the solid lubricant have a low shearing resistance in their crystalline structure. They are between two surfaces and take over the lubricating function.

Sliding speed

The maximum sliding speed is 30 m/min.

Under ideal conditions of guide clearance, stroke length, radial load and heat dissipation stroke speeds of 300 – 400 strokes/min. can be achieved with the Steinel precision sliding guide with solid lubricant.

Guide clearance

The clearance is 2 – 7 µm. If more clearance is required, please indicate it on the order as "honed for easy slide fit".

Sliding guide with solid lubricant bands

Steinel precision guides

Ball guides

Special features of Steinel precision ball guides

Precision due to the microfinished contact surfaces and uniformly selected precision steel balls.

Friction-free movement due to the rolling motion of the balls.

Clearance-free guidance due to the optimal preloaded rolling motion of the balls between the guide pillar and guide bushing.

Long lifespan due to the free-wheeling mounting and helical positioning of the balls, so that each ball has its own track.

High-load capacities, precision guidance and high stroke speeds are achieved due to the highest precision of the uniformly selected precision steel balls, honed guide bushings and superfine ground guide pillars. The large number of balls in the cage as well as an even force distribution in the guidance system allow high stroke speeds of 30 – 40 m/min and more.

Interchangeability is ensured due to the uniformly selected precision steel balls.

Special designs can be manufactured according to your drawings.

Loading capacities

Guide pillar diameter d_1	Ball diameter d_k	F (stat.) in N/cm carrying guide length
10/12	2	450
15/16	3	580
19/20	3	800
24/25	3	950
30/32	4	1350
38/40	4	1900
48/50	4	2400
60/63	5	3000
80	6	3300

Load capacities – preload

The radial load capacity of the ball guide grows with the increasing preload while simultaneously decreasing the friction-free movement. Extremely high preloading will overstrain the ball guide due to the excessive surface pressure on the balls.

The preload in a paired ball depends on the guide diameter:

- from $\varnothing 10 - 12 = 3 - 5 \mu\text{m}$
- from $\varnothing 15 - 20 = 4 - 6 \mu\text{m}$
- from $\varnothing 24 - 32 = 6 - 9 \mu\text{m}$
- from $\varnothing 38 - 50 = 9 - 12 \mu\text{m}$
- from $\varnothing 60 - 80 = 11 - 14 \mu\text{m}$

Ball cage with safety part and screw

Special characteristic: guide pillars mounted in the upper plate and the possibility for the ball cage to come completely out of the guide bushing.

Limiting sleeve

Special characteristic: Prevents the ball cage from shifting down.

Low maintenance is needed for the practically maintenance-free ball guides. Lubrication with a high-performance grease when mounting is sufficient for continuous operation.

Component arrangement and function

The Steinel precision ball guide is composed of a guide pillar, guide bushing and ball cage, which are tensionally paired by preloading.

Due to the tensional structure of the balls within the cage, the ball cage only travels at half the speed of the ball guide motion. The travel length of the ball cage is always half of the stroke of the guide bushing or the guide pillar.

Fields of application

Steinel precision ball guides are used for longitudinal and rotary motion in the manufacture of tools, fixtures, machines, measuring instruments, medical devices and automobiles.

Aluminium ball cages are distinguished by having less mass than compared to brass.

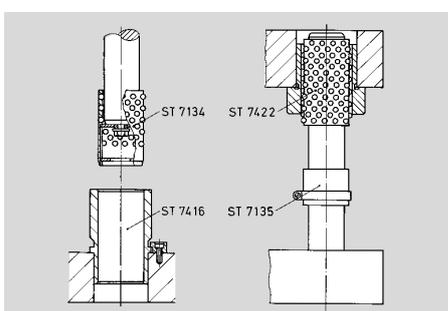

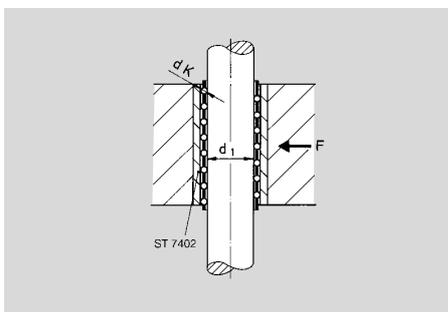

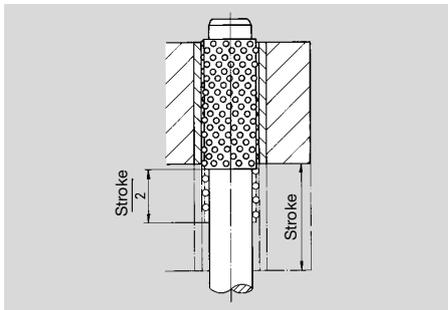

Since the only function of the cage is to act as a carrier, every bit of weight reduction means reduced energy loss with the same stability of the cage, especially at the return of the stroke.

Brass ball cages can be used universally. They have a high mechanical strength, superior sliding properties as well as a high wear resistance and stability. Due to their high-temperature strength, they are suitable for temperatures over 80 °C. Their sturdiness makes them ideal for use in machines and tools with high precision demands.

Plastic ball cages are distinguished by having less mass than compared to other materials. They are used where high stroke speeds are reached. The plastic is also suitable for use in aggressive surroundings.

Steinel precision guides

Roller guides

Fields of application

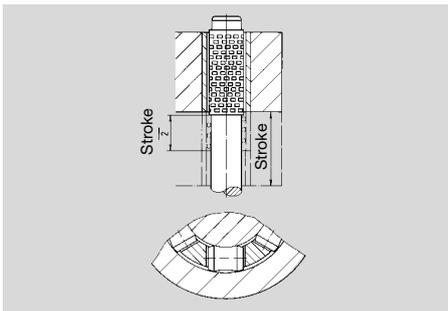

Steinel precision roller guides are used for longitudinal motion in the manufacture of tools, fixtures, machines, measuring instruments, medical devices and automobiles. Rotary motion is not possible!

A profile roller can absorb six times the load of the same-sized ball before it will begin to deform.

The contact radii of the roller's saddle shape are manufactured in such a way that critical loadings on the edge area will be avoided, which results in an extended life of the roller cage.

The bending as a result of the load in the middle surface to the outer track will result in a deflection below 0.05 µm, which can be neglected.

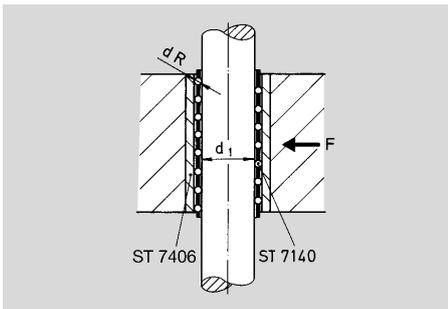

The relatively higher costs compared to the standard ball guide will be more than compensated by the superior performance achieved.

Component arrangement and function

The Steinel precision roller guide is composed of a guide pillar, guide bushing and roller cage, which are tensionally paired by preloading.

Due to the tensional structure of the rollers within the cage, the roller cage only travels at half the speed of the roller guide motion. The travel length of the roller cage is always half of the stroke of the guide bushing or the guide pillar.

Load capabilities - preload:

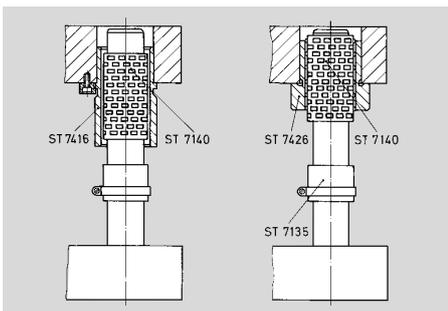

The radial load capability of the roller guide grows with the increasing preload while simultaneously decreasing the friction-free movement. Extremely high preloading will overstrain the roller guide due to the excessive surface pressure on the rollers.

Loading capacities

Guide pillar diameter d_1	Roller diameter d_R	F (stat.) in N/cm per roller cage
19/20	3	1700
24/25	3	2250
30/32	4	3450
38/40	4	4700
48/50	4	4700
60/63	5	5900
80	6	8750

The preload in a paired roller guide depends on the guide pillar diameter:

- from $\varnothing 19 - 20 = 2 - 4 \mu\text{m}$
- from $\varnothing 24 - 32 = 4 - 5 \mu\text{m}$
- from $\varnothing 38 - 50 = 5 - 7 \mu\text{m}$
- from $\varnothing 60 - 80 = 7 - 9 \mu\text{m}$

Limiting sleeve

Special characteristic:
Prevents the ball cage from shifting down.

Stroke speeds

With optimal use, the stroke speeds can reach up to 40m/min and more.

Special features of the Steinel precision roller guides

Precision due to the microfinished contact surfaces and uniformly selected precision profile rollers.

Friction free movement due to the rolling motion of the rollers.

Clearance free guidance due to the optimal preloaded rolling motion of the profile rollers between the guide pillar and guide bushing.

Long lifespan due to the free-wheeling mounting and helical positioning of the profile rollers, so that each roller has its own track.

Aluminium roller cages are distinguished by having less mass than compared to other materials. Since the only function of the cage is to act as a carrier, every bit of weight reduction means reduced energy loss with the same stability of the cage, especially at the return of the stroke. Due to the large stroke movements, an unwanted slipping effect of the roller cage will be considerably reduced by the aluminium cage, thus extending the working life of the guide.

Low maintenance is needed for the practically maintenance-free roller guides. Lubrication with a high-performance grease when mounting is sufficient for continuous operation.

High-load capacities, precision guidance and high stroke speeds are achieved due to the highest precision of the uniformly selected profile rollers, honed guide bushings and superfine ground guide pillars. The large number of supporting rollers in the running surface as well as an even force distribution in the guidance system allow high stroke speeds.

Interchangeability is ensured due to the uniformly selected precision profile rollers.

Special designs can be manufactured according to your drawings.

Guide pillars ST 7190

Mini-series

STEINEL[®]
NORMALIEN

Material:

Ø d 4 – 6 mm steel 1.2379 hardened, hardness 60+3 HRC

from Ø d 8 mm steel, 1.7131 induction hardened, depth of hardening 0,8 – 1,2 mm, depends on Ø, hardness 60 – 64 HRC

Steinel-guide pillars are ground on all sides. The guide diameter is super-fine ground finish and lapped to tolerance ISO h3. Roundness and cylindricity within ISO h1. Mount into mounting holes ISO P6.

Order example: Guide pillar **ST 7190**

d₁ = 8, l = 80 mm

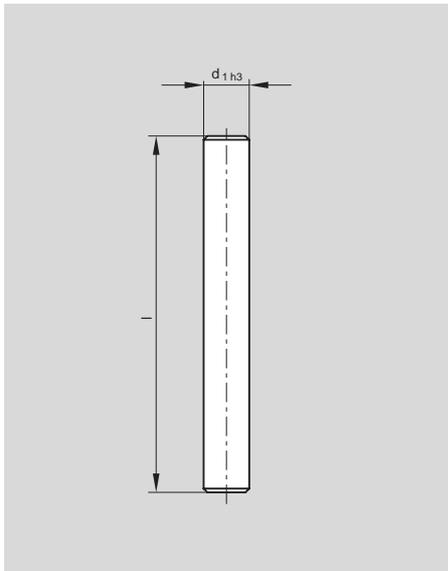

Add **08 x 080**

Order number **ST 7190.08 x 080**

Ball bearings – Mini series

Steinel ball-bearings are distinguished by exceptional precision and friction-free movement. Therefore they find a wide acceptance as a construction element for electrical and optical measuring instruments and measuring systems. They will be used successfully in machines, instruments and technical equipment of high precision.

Special features of Steinel precision ball guides

Friction-free movement due to the roll motion.

Zero clearance guiding is achieved due to the precision preloaded rolling motion on the balls between guide pillar and bush.

Interchangeability will be achieved by uniformly selected steel balls.

Special designs can be manufactured according to your drawing.

Guide bushes ST 7191

Mini-series

Material:
steel 1.3505 (100 Cr 6) hardened,
hardness 61 – 63 HRC

Explanation:
Steinel-guide bushes are ground on all sides.
The guide diameter (bore) is super-fine honed
and will be matched with the pillar to ensure an
optimal preload.
Roundness and cylindrically within ISO h1.

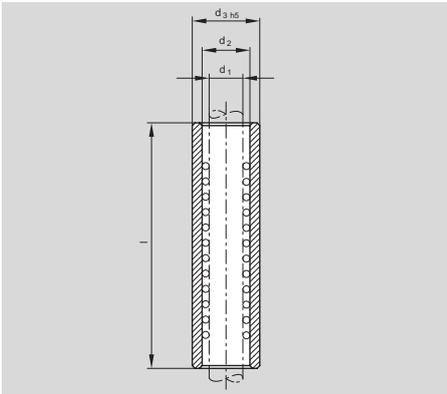

Order example: Guide bush **ST 7191**
 $d_1 = 8, l = 30$ mm
Add **08 x 030**
Order number **ST 7191.08 x 30**

Mounting instructions:
If possible avoid press fit. Fit in tensionfree
into the mounting bore hole ISO H6 and
secure it with glue.

Ball cages ST 7192

Mini-series

Material: Ball cages made of brass,
balls of steel, hardened, grade 1, sorted.

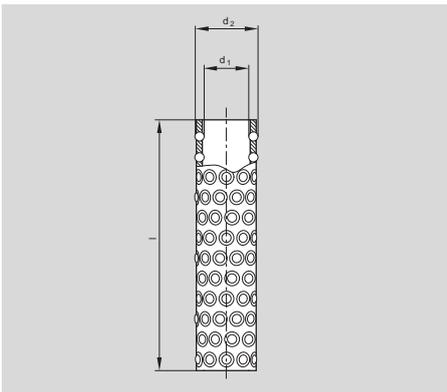

Explanation:
The Steinel-ball cages will be assembled
absolutely tensionfree and are freely movable.
The careful production and control guarantee
an exceedingly friction-free axial and radial
movement.

Order example: Ball cage **ST 7192**
made of brass
 $d_1 = 8, l = 30$ mm
Add **08 x 030**

Guide pillars ST 7100

precision ground for press fitting

DIN 9825, ISO 9182

Material: Steel 1.11221 (Ck60)
induction hardened, hardness 62-64 HRC

Guide diameter ISO h3 superfinish ground
and microfinished
mounting into mounting-holes ISO R6

Application: Due to the high precision of the
guide pillars ST 7100 they are suitable to all
Steinel guide bushes for sliding, ball and roller
guides.

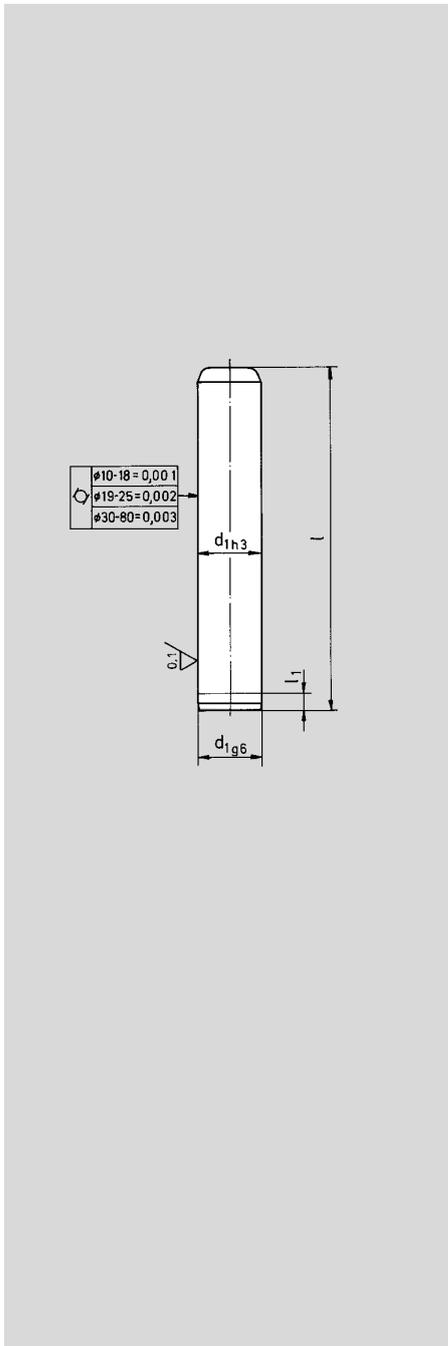

Upon request also available grooved for holding
ring. Please add part number description "with
groove and holding ring ST 7105" to your order.

Order example: Guide pillar **ST 7100**

Guide pillars ST 7106 – ST 7108

precision ground for press fitting with internal thread

STEINEL[®]
NORMALIEN

Similar to DIN 9825/ ISO 9182

Material: Steel 1.11221 (Ck 60)
induction hardened, hardness 62-64 HRC

Guide diameter ISO h3 superfinish ground
and microfinished
mounting into mounting-holes ISO R6

Application: Due to the high precision of the
guide pillars ST 710, they are suitable to all
Steinel guide bushes for sliding, ball and roller
guides. Especially in connection with ball cages
ST 7134.

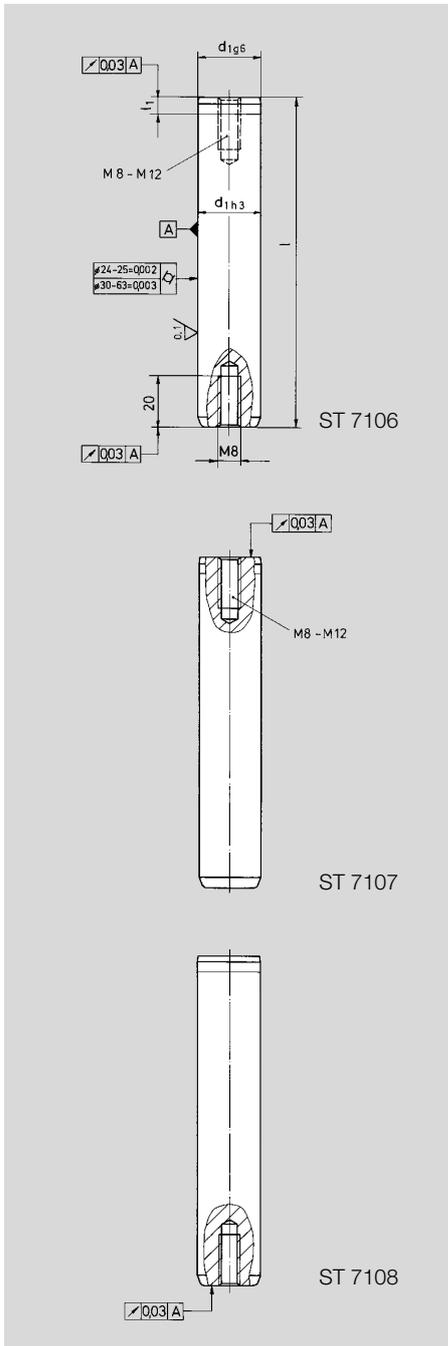

Smooth guide pillars with internal thread are
manufactured in 3 types: guide pillar with
2 internal threads, guide pillar with internal
thread on the press-in side, guide pillar with in-
ternal thread on the guide side.

Order example: Guide pillar **ST 7108**

$d_1 = 25, l = 180$ mm

Add **25 x 180**

Order number **ST 7108.25 x 180**

Mounting of the guide pillars

Before inserting the pillars into the upper plate, clean the holes thoroughly and oil lightly (no grease). Do the same with the holes in the lower plate. Put parallel bars between upper and lower plate. Drive the pillars about 3 mm into the lower plate (use rubber mallet). Complete the press fit of the pillars using a hydraulic or hand screw press (once pillar fit ISO h3 and hole fit ISO R6 is achieved the press fit is guaranteed).

Disassembly of the guide pillars

Disassembly of the guide pillars

Always press out towards the top of the lower plate, never press out towards the bottom, because the high surface quality could then be destroyed.

Guide pillars ST 7117

with middle mount shoulder

Material:

steel 1.1221 (Ck 60) induction hardened,
hardness 62 – 64 HRC

Guide diameter ISO h3 super-fine ground finish
Mounting diameter ISO js4
Mount into mounting hole ISO H6

Order example: Guide pillar ST 7117

with middle mount shoulder
 $d_1 = 25$, $l_1 = 110$ mm, $l_2 = 90$ mm
Add **25 x 110 x 090**

Order number **ST 7117.25 x 110 x 090**

Application: Guide pillars with middle mount shoulder are matchable to all Steinel guide bushes for sliding and ball guides.

The pillars with middle mount shoulder improve the side load capacity of tools using guide plate.

Due to the mid-point fastening of the pillars on the guide plate, they have only half the length of application point of force as conventionally mounted pillars. These pillars consequently have eight fold increase in loading capacity.

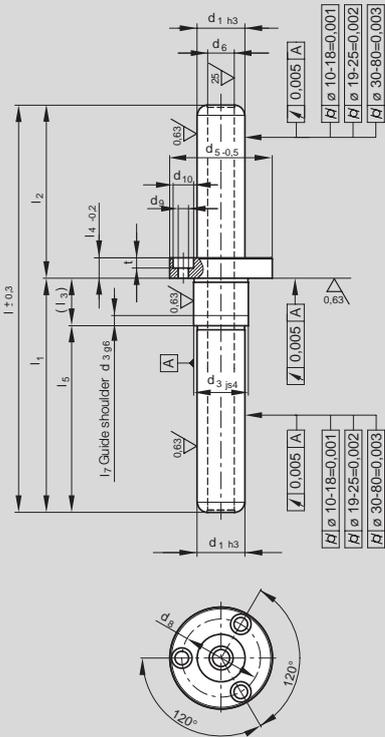

On pillar diameters of 32 or greater there is a free bore with these to reduce changes in weight of the moving mass.

Guide pillars ST 7118

with small middle mount shoulder

Material:

steel 1.1221 (Ck 60) induction hardened,
hardness 62 – 64 HRC

Guide diameter ISO h3 super-fine ground finish
Mounting diameter ISO js4
Mount into mounting hole ISO H6

Guide pillars with small middle mount
Shoulder are secured with three holding
clamps ST 7367 (included).

Order example: Guide pillar **ST 7118**

with middle mount shoulder
 $d_1 = 25$, $l_1 = 110$ mm, $l_2 = 90$ mm

Add **25 x 110 x 090**

Order number **ST 7118.25 x 110 x 090**

Application: Guide pillars with middle mount
shoulder are matchable to all Steinel guide
bushes for sliding and ball guides.

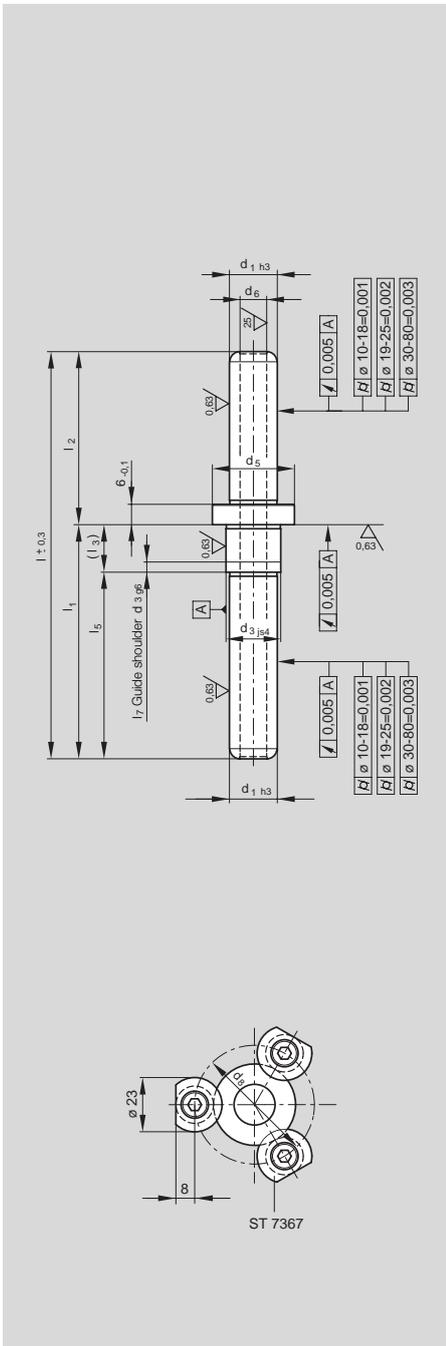

The pillars with middle mount shoulder improve
the side load capacity of tools using guide plate.

Due to the mid-point fastening of the pillars on
the guide plate, they have only half the length of
application point of force as conventionally
mounted pillars. These pillars consequently have
eight fold increase in loading capacity.

On pillar diameters of 32 or greater there is a
free bore within these to reduce changes in
weight of the moving mass.

Guide pillars ST 7120, ST 7126 with shoulder

ST 7120

ST 7126

Made of solid material

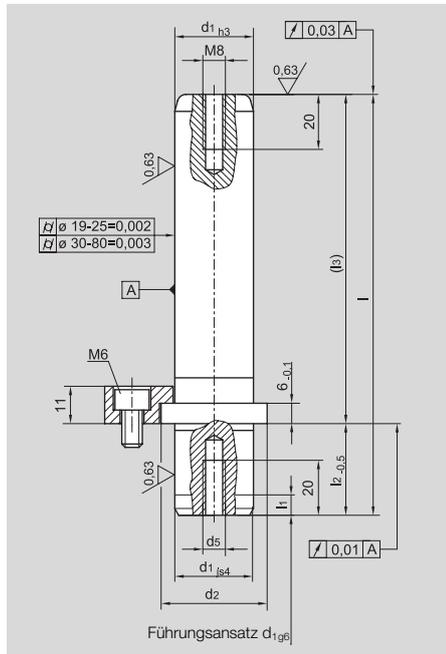

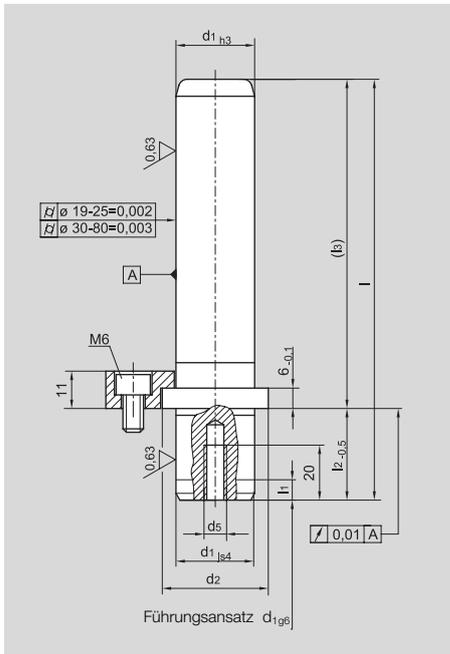

DIN 9825/ISO 9182

Material: Steel 1.11221 (Ck 60)
induction hardened, hardness 62-64 HRC

Guide diameter ISO h3 super-fine ground finish
Mounting diameter ISO js4
Mounting into mounting holes ISO H6

Guide pillars with shoulder enable an easy and quick assembly and disassembly of the pillars, as for example in the case where you wish to sharpen cutting tools with a surface grinder.

Guide pillars with shoulder are secured with three holding clamps ST 7367 (included). **(Fig. 1)**

Alternative the guide pillars can be fixed with the holding disc (Fig. 2) ST 7387 (order separately).

Application: Guide pillars with shoulder are suitable to all Steinel guide bushes for sliding, ball and roller guides.

Order example: Guide pillar **ST 7120** with shoulder
 $d_1 = 19$, $l_3 = 140$ mm, $l = 163$ mm
Add **19 x 140 x 163**
Order number **ST 7120.19 x 140 x 163**

Order example: Guide pillar **ST 7126** with shoulder and 2 internal threads
 $d_1 = 24$, $l_3 = 200$ mm, $l = 227$ mm
Add **24 x 200 x 227**
Order number **ST 7126.24 x 200 x 227**

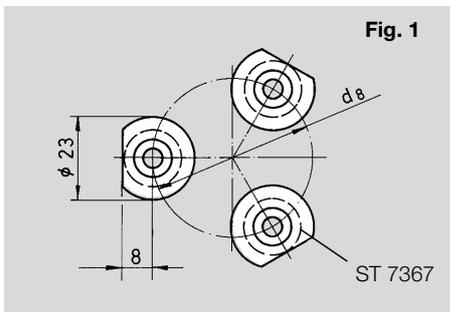

Fig. 1

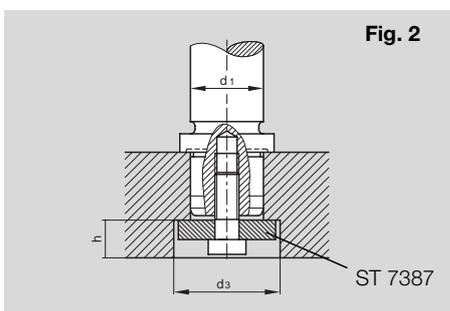

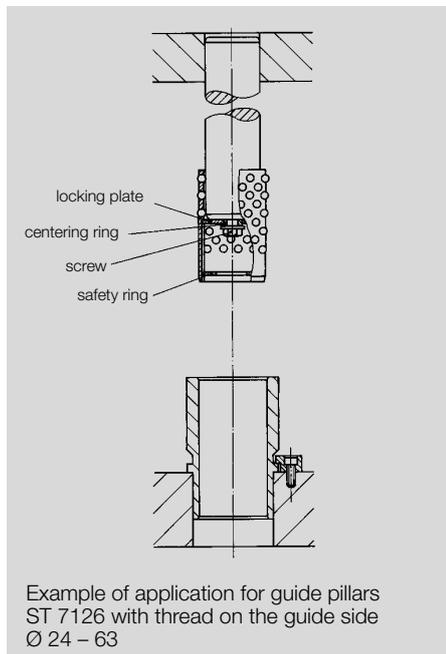

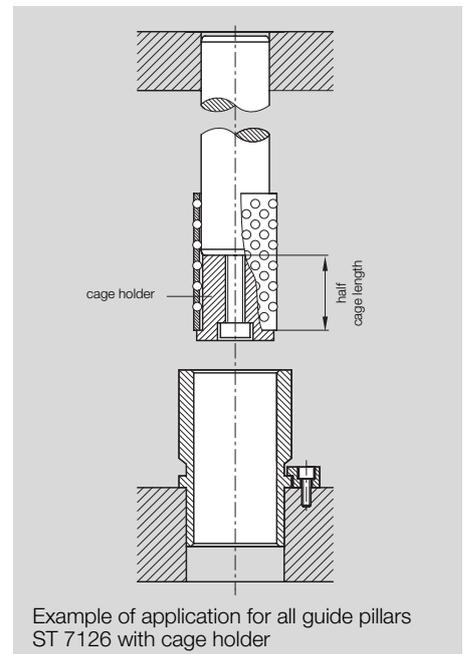

Fig. 2

Example of application for guide pillars ST 7126 with thread on the guide side $\text{Ø } 24 - 63$

Example of application for all guide pillars ST 7126 with cage holder

Guide pillars ST 7120, ST 7126

with shoulder

Quick-change guide pillars ST 7181

with disc and screw

STEINEL®
NORMALIEN

Material: steel 1.1221 (Ck 60)
induction hardened, hardness 62 – 64 HRC

DIN 9825/ISO 9182

Guide diameter ISO h3 super-fine ground finish, taper shank ground, complete with disc SZ 7368 and cylindrical screw with hexagonal recessed hole SZ 8512.

Application: Quick-change guide pillars with taper shank enable a quick exchange of pillars. Where the pillars often have to be removed in order to sharpen the die, the working time of the tool make is drastically reduced by the use of quick-change guide pillars.

The hardened and precision ground taper of the guide pillar guarantees the perfect remounting into the same position. Mismatch and angle error are not occurring. The light taper in connection with disc and screw ensure the absolutely fixe chucking of the pillars.

Quick-change guide pillars are suitable to all Steinel guide bushes for slide, ball and roller guide.

Upon request all Steinel die-sets can be furnished with quick-change guide pillars and holding bushings.

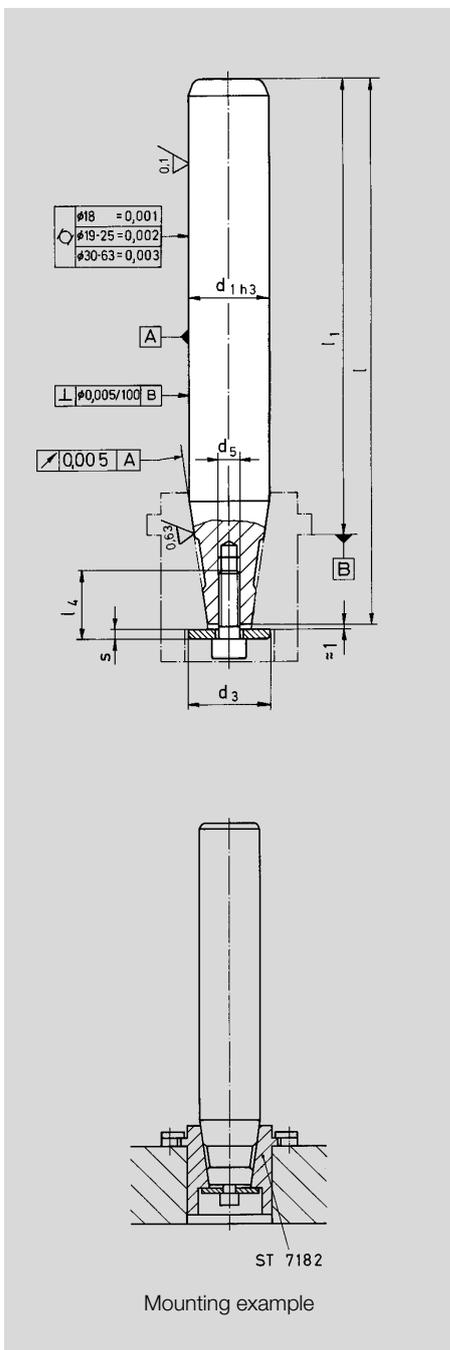

Matching holding bushes: ST 7182

Pillar holding bushes ST 7182

with holding clamps

Material:
steel 1.7131 (16 Mn Cr 5) case hardened,
hardness 58 – 60 HRC
inside taper ground
mounting diameter ISO j6, ground

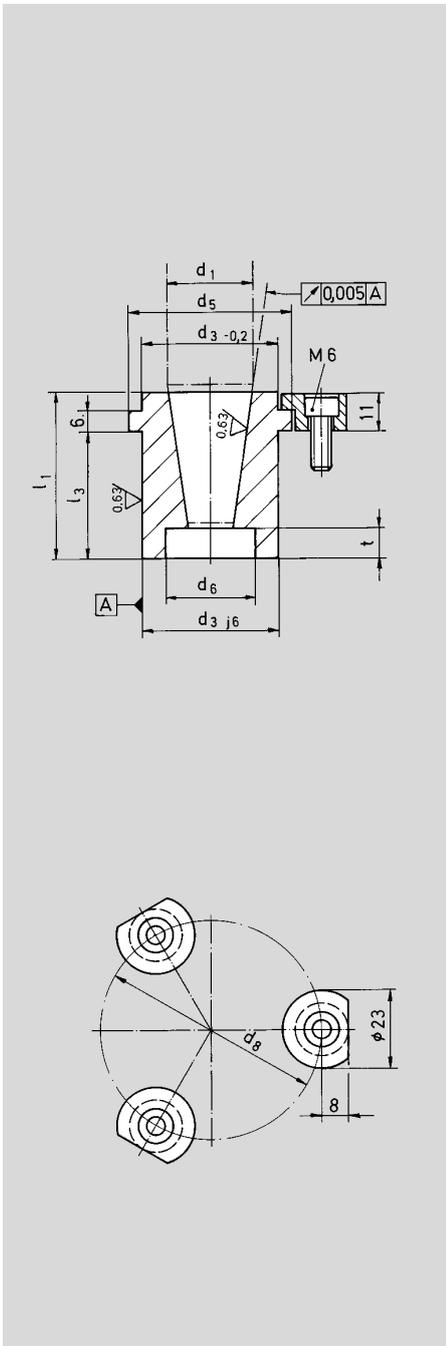

Suitable to quick-change guide pillars ST 7181

Mounting instructions:
Mount into mounting hole ISO H6, secured with
3 holding clamps ST 7367 (included).
Mounting diameter d3 corresponds with
diameter of guide bushes with flange ST 742,
and with shoulder ST 741.
Advantage: same mounting holes in all plates.

Holding clamps:
when reordering the holding clamps,
please indicate 1 set = 3 pieces
Order number ST 7367

Order example: Pillar holding bushes **ST 7182**
d₁ = 24 bzw. 25, l₃ = 37 mm
Add **25 x 37**

ST 7160

Guide bushes ST 746.

Sliding guide, for large tools

DIN 9834/ ISO 9448

Technical description:

Guide diameter ISO H7 precision turned
Mounting diameter ISO h6 ground

ST 7460 solid bronze

for usual load, good lubrication is necessary

ST 7469 steel, bronze plated

steel 1.7131 (16 Mn Cr 5)
induction hardened, hardness 61-63 HRC
sliding surface bronze plated
Due to the bronze plating on the hardened steel jacket this bush qualifies especially for high sliding speeds and extreme lateral forces.
Good lubrication is necessary.

Mounting instructions:

Adjust in mounting bore hole ISO H7.
Fix with 2 holding clamps (not included in delivery).

The shoulder surface, right-angled ground to the guide bore, will be squeezed onto the plate by the holding clamps and guarantees an absolutely rigid clamping of the guide bush.

Ball cages ST 7170

made of aluminium, with installation assistance

Material: ball cage made of aluminium balls of steel, hardened, grade 1, sorted

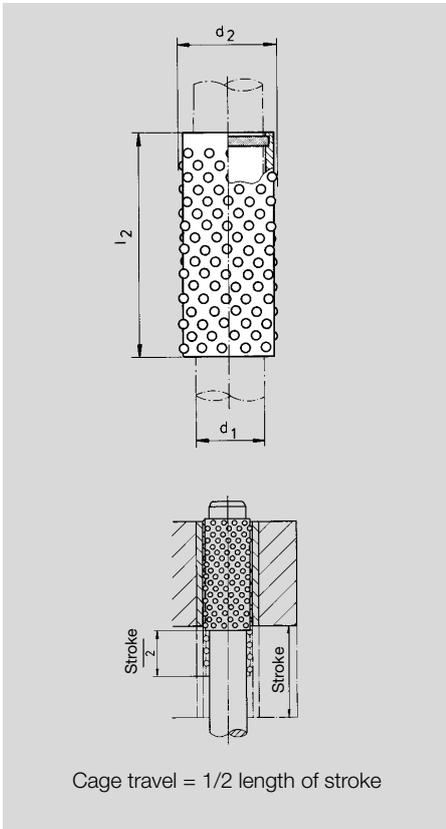

The balls in the cage holes are free-wheeling wedges. They are helically arranged in the axial direction, so that each ball has its own race.

The installation assistance in the ball cage makes the assembly of the die sets within multiple guiding units simpler.

Aluminium ball cages are universally utilizable. They have a high mechanical endurance, as well as excellent sliding characteristics, a high resistance to abrasion and great stability.

Due to their optimum heat stability, they are suitable for use in temperatures of over 80 °C.

Extremely robust construction, utilizable in machines and tools with extremely high precision demands.

Ball cages ST 7171

made of aluminium, with safety ring

Material: ball cage made of aluminium balls of steel, hardened, grade 1, sorted

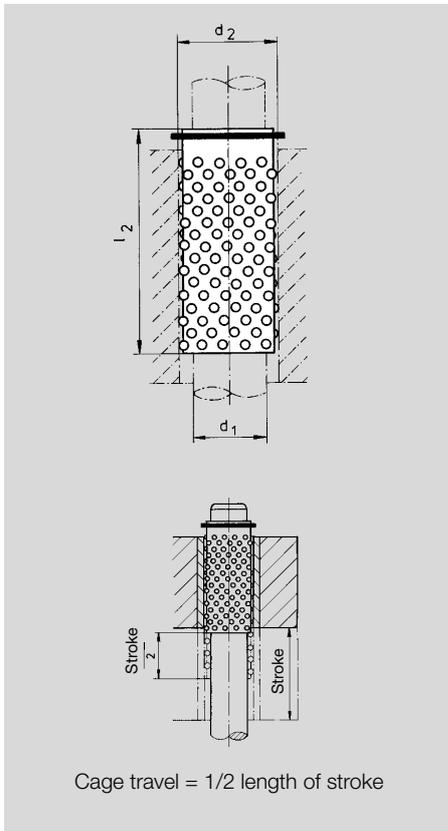

The balls in the cage holes are free-wheeling wedges. They are helically arranged in the axial direction, so that each ball has its own race.

The ball cages are constructed with a safety ring according to DIN 471.

Aluminium ball cages are universally utilizable. They have a high mechanical endurance, as well as excellent sliding characteristics, a high resistance to abrasion and great stability.

Due to their optimum heat stability, they are suitable for use in temperatures of over 80 °C.

Extremely robust construction, utilizable in machines and tools with extremely high precision demands.

Roller cages ST 7140

made of aluminium

Material: Roller cage made of aluminium, profile rollers of steel, hardened, grade 1, sorted.

The profile rollers in the cage holes are free-wheeling wedged. Thus a protection against torsion is guaranteed. The rollers are helically arranged in the axial direction, so that each roller has its own race.

Sturdy workmanship, universally adaptable.

Roller cage matching to guide pillars ST 7100, ST 7106, ST 7107, ST 7108, ST 7117, ST 7118, ST 7120, ST 7126, ST 7127, ST 7128 and to all ball guide bushes.

Additional guide diameters and lengths according to the ball cages ST 7130 are available upon request.

Ball cages ST 7150

made of brass

STEINEL[®]
NORMALIEN

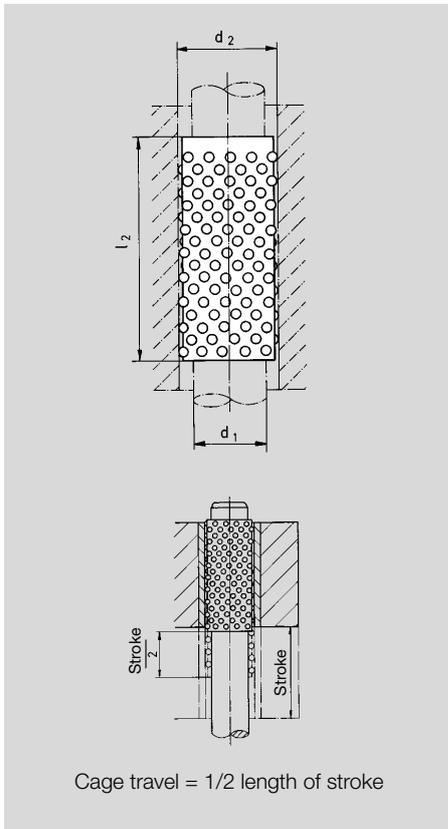

Material: ball cage made of brass, balls of steel, hardened, grade 1, sorted

The balls in the cage holes are free-wheeling wedges. They are helically arranged in the axial direction, so that each ball has its own race.

Ball cages made of brass are universally utilizable. They have a high mechanical strength, best antifriction properties as well as high abrasive resistance and stability.

Due to their optimum heat resistance they are suited for temperatures over 80 °C.

Sturdy workmanship usable in machines and tools with high precision demands.

Cage travel = 1/2 length of stroke

Sturdy workmanship, universally adaptable.

Matching guide pillars ST 7100, ST 7106, ST 7107, ST 7108, ST 7117, ST 7118, ST 7120, ST 7126, ST 7127, ST 7128, ST 7181/82 and to all ball guide bushes.

Ball cages ST 7151

made of brass, with installation assistance

Material: ball cage made of brass, balls of steel, hardened, grade 1, sorted

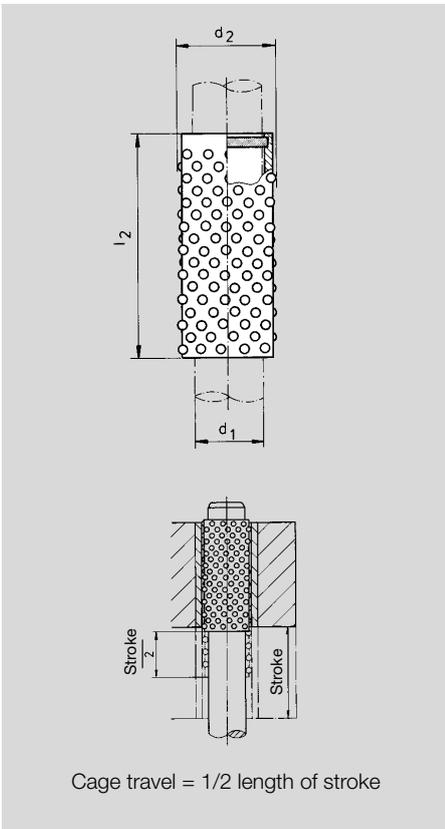

The balls in the cage holes are free-wheeling wedges. They are helically arranged in the axial direction, so that each ball has its own race.

The installation assistance in the ball cage makes the assembly of the die sets with multiple guiding units simpler.

Ball cages made of brass are universally utilizable. They have a high mechanical strength, best antifriction properties as well as high abrasive resistance and stability.

Due to their optimum heat resistance they are suited for temperatures over 80 °C.

Sturdy workmanship usable in machines and tools with high precision demands.

Ball cages ST 7174

made of plastic with safety ring

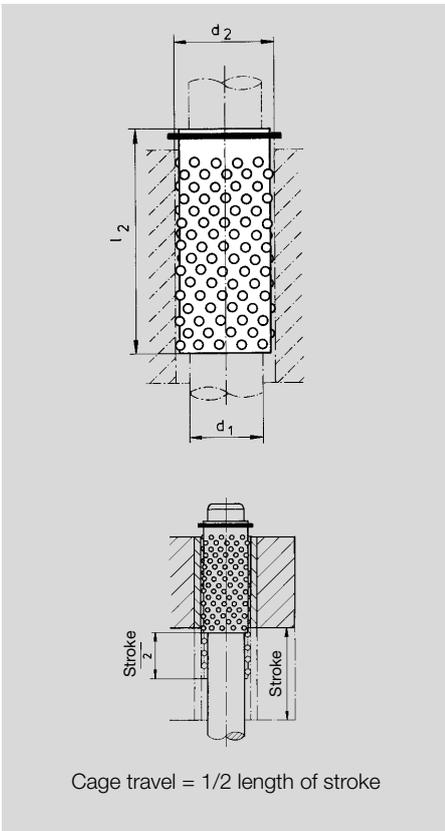

Material: Ball cage made of plastic, balls made of steel, hardened, grade 1, sorted.

The balls in the cage holes are free-wheeling wedged. They are helically arranged in the axial direction, so that each ball has its own race.

The ball cages with a safety ring are made in accordance to DIN 471.

Matching guide pillars ST 7100, ST 7106, ST 7107, ST 7108, ST 7117, ST 7118, ST 7120, ST 7126, ST 7127, ST 7128, ST 7181/82 as well as to all guide bushes using ball cages.

Ball cages ST 7134

made of aluminium

Ball cage complete with holding safety device

Material: ball cage made of aluminium, balls of steel, hardened, grade 1, sorted

The balls in the cage holes are free-wheeling wedges. They are helically arranged in the axial direction, so that each ball has its own race. In the area of both longitudinal grooves as well as in the area of safety grooves the balls are eliminated.

Sturdy workmanship, universally utilizable.

Application: In all die-sets where the guide pillars are fastened into the upper plate. The locking plate holds the ball cage and allows a complete retraction from the guide bush.

Suitable especially to the guide pillars ST 7106 and ST 7108 and to all ball guide bushes.

Technical description: see page 3.04

Cage holder

Material: Steel

The cage holder can be used for all ball and roller cages. The lengths of the cage holder should be half the lengths of the cage in use. (If necessary please machine down.)

Application: In all die sets in which the guide posts are fastened in the upper part. The cage holder supports the ball cage and permits a complete removal from the guide bush.

Guide and pillar bearings ST 720.

with rectangular flange

STEINEL[®]
NORMALIEN

Guide bearings ST 720.

Material: basic body special grey cast iron GG 25 as one chooses with pressed in guide bush (see below.)
Guide diameter ISO H5, honed.
If sliding guide lubrication by funnel grease nipple at the flange.

Pillar bearings ST 7200

Material: special grey cast iron GG 25 mounting holes ISO R6 precision turned. Both flange surfaces machined, with mounting holes.

ISO 11903

Indication: please order matchable guide pillars ST 7100 separately.

Upon request centering by standing over guide pillars respectively guide bushes.

Guide bearings can be supplied as well with roller cages.

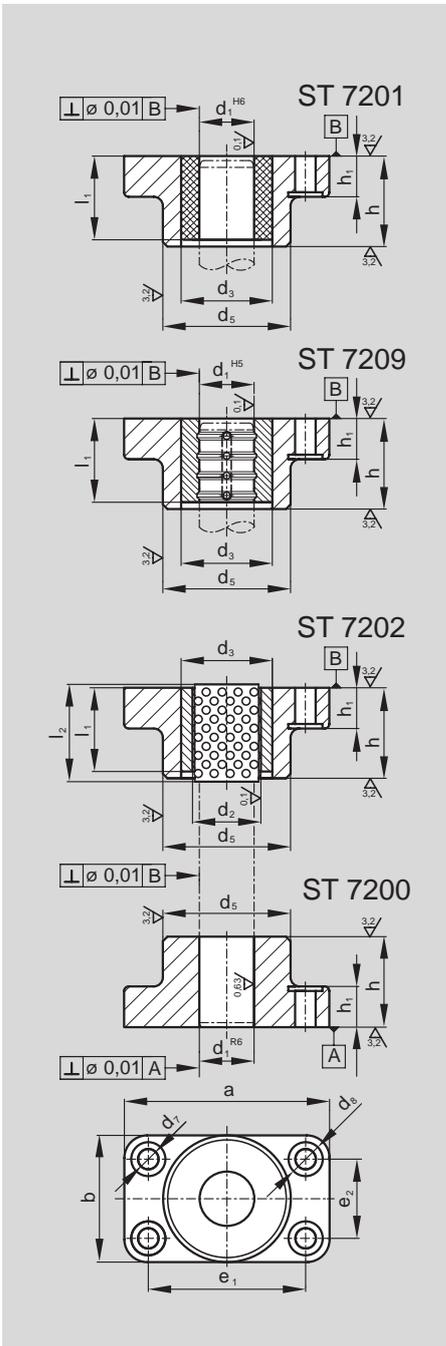

Order example: guide bearing **ST 7202**

with ball guide

$d_1 = 19$ mm

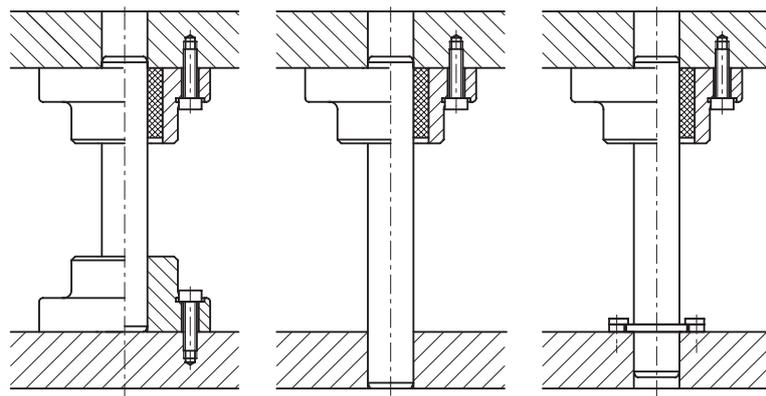

Add **19**

Order number **ST 7202.19**

Guide bushes ST 7319

smooth, sliding guide steel bronze plated

Material: steel 1.3505 (100 Cr6)
hardened, hardness 61-63 HRC
sliding surface bronze plated

Guide diameter ISO H5, honed
mounting diameter ISO p6, ground

Important: Due to the galvanically applied bronze plating onto the hardened steel jacket, this bush is suitable especially for high sliding speeds and strong lateral forces.

Matching guide pillars: ST 7100, ST 7106, ST 7107, ST 7108, ST 7117, ST 7118, ST 7120, ST 7126, ST 7127, ST 7128, ST 7181/82

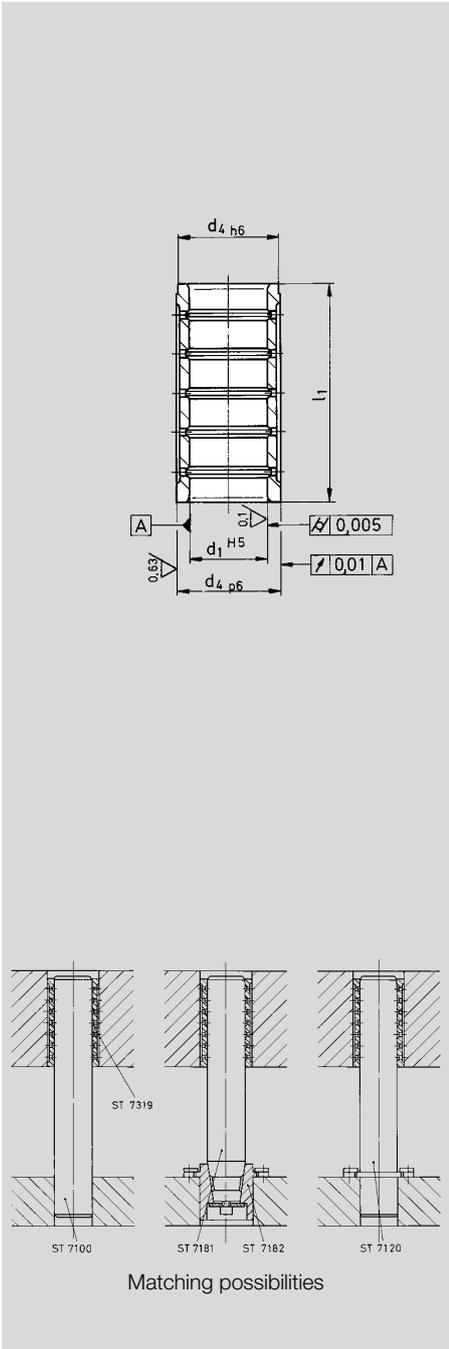

Mounting instructions:

1. To glue into the mounting bore hole ISO F6
When gluing ensure that the oil distribution groove remains clear at the mounting diameter. (Bonding agent see to corresponding page)
2. If possible avoid press fit, because the internal diameter will decrease.
3. Do not pour in because the oil distribution groove at the mounting diameter will be clogged.

Technical description: see page 3.03

Guide bushes ST 7409

smooth, sliding guide steel bronze plated

STEINEL®
NORMALIEN

Material: steel 1.3505 (100 Cr6)
hardened, hardness 61-63 HRC
sliding surface bronze plated.

Guide diameter ISO H5, honed
mounting diameter ISO j6, ground

Important: Due to the galvanically applied bronze plating onto the hardened steel jacket, this bush is suitable especially for high sliding speeds and strong lateral forces.

Matching guide pillars: ST 7100, ST 7106, ST 7107, ST 7108, ST 7117, ST 7118, ST 7120, ST 7126, ST 7127, ST 7128, ST 7181/82

DIN 9831/ISO 9448

Mounting instructions:

- To glue into the mounting bore hole ISO H6
When gluing ensure that the oil distribution groove remains clear at the mounting diameter.
(Bonding agent see to corresponding page)
- If possible avoid press fit, because the internal diameter will decrease.
- Do not pour in because the oil distribution groove at the mounting diameter will be clogged.
Guide bushes for pour in see ST 7411.

Guide bushes ST 7411

smooth, to pour in, sliding guide steel bronze plated

Material: steel 1.3505 (100 Cr6) hardened, hardness 61-63 HRC sliding surface bronze plated

Guide diameter ISO H5, honed
Mounting diameter machined with grooves for casting resin

Important: Due to the galvanically applied bronze plating onto the hardened steel jacket, this bush is suitable especially for high sliding speeds and strong lateral forces.

Matching Guide pillars: ST 7100, ST 7106, ST 7107, ST 7108, ST 7117, ST 7118, ST 7120, ST 7126, ST 7127, ST 7128, ST 7181/82

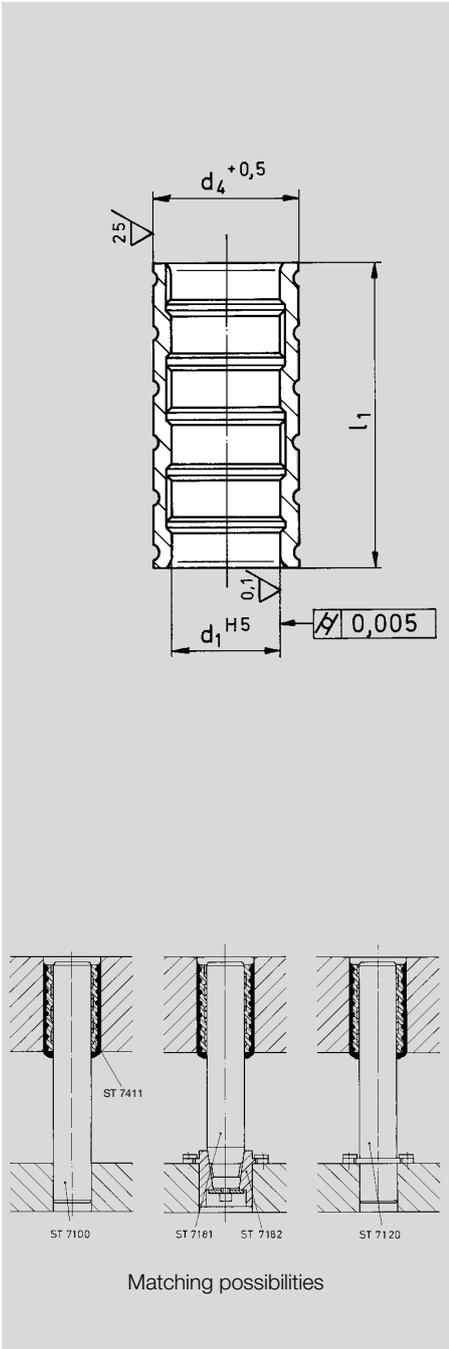

DIN 9831/ISO 9448

Mounting instructions: For lubricating reasons assemble guide bush ST 7411 vertically with the air groove upwards.

Mounting bore hole: Provide $d_4 +1$ to $+4$ mm as casting gap.

Technical description: see page 3.03

Order example: Guide bush **ST 7411**
 $d_1 = 16$, $l_1 = 37$ mm

Guide bushes ST 7491

smooth, sliding guide with solid lubricant

Material:
Steel with insert of solid lubricant
Due to the insert solid lubricant, this sliding guide is self-lubricating and is suited for higher loads.

Outside diameter ISO H6, precision turned
mounting diameter ISO j6, precision turned

Matching Guide pillars: ST 7100,
ST 7106, ST 7107, ST 7108, ST 7117,
ST 7118, ST 7120, ST 7126, ST 7127,
ST 7128, ST 7181/82

**Dimensions according to
DIN 9831/ISO 9448**

Mounting instructions:

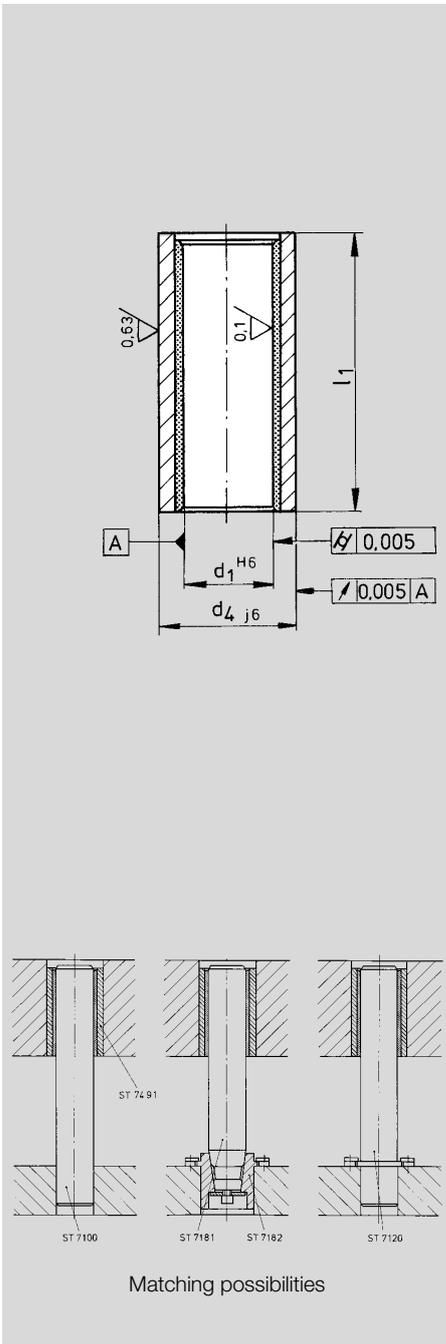

1. Glue into the mounting bore hole ISO H6.
(Bonding agent see to corresponding page)
2. If possible avoid press fit, because the internal diameter will decrease.

Order example: Guide bush **ST 7491**

$d_1 = 16, l_1 = 37$ mm

Add **16 x 037**

Order number **ST 7491.16 x 037**

Guide bushes ST 7403

smooth, roller guide

Material:

Guide bushes made of steel 1.3505 (100 Cr 6) hardened, hardness 61-63 HRC roller cage made of aluminium, profile rollers made of steel, hardened, grade 1, sorted

Guide diameter d_2 honed, suitable to roller cage and guide pillar mounting diameter ISO j6, ground.

Important: If possible order the complete roller guide, so that it can be matched with the correct fit

Matching Guide pillars: ST 7100, ST 7106, ST 7107, ST 7108, ST 7117, ST 7118, ST 7120, ST 7126, ST 7127, ST 7128, ST 7181/82

DIN 9831/ISO 9448

Mounting instructions:

1. To glue into the mounting bore hole ISO H6 (Bonding agent see to corresponding page)

2. If possible, avoid press fit, because the internal diameter will decrease.

Guide bushes ST 7405

smooth, ball guide plastic

Material:

Guide bushes made of steel 1.3505 (100 Cr 6) hardened, hardness 61-63 HRC
Ball cage made of plastic
Balls made of steel, hardened, grade 1, sorted

Guide diameter d_2 honed, matched to ball cage and guide pillar.
Mounting diameter ground to ISO j6.

Important: If possible, order the complete ball guide so that it can be matched with the correct preload.

Matching guide pillars: ST 7100, ST 7106, ST 7107, ST 7108, ST 7117, ST 7118, ST 7120, ST 7126, ST 7127, ST 7128 and ST 7181/82.

Guide bushes without ball cage ST 7406
Ball cage only ST 7133

Mounting instructions:

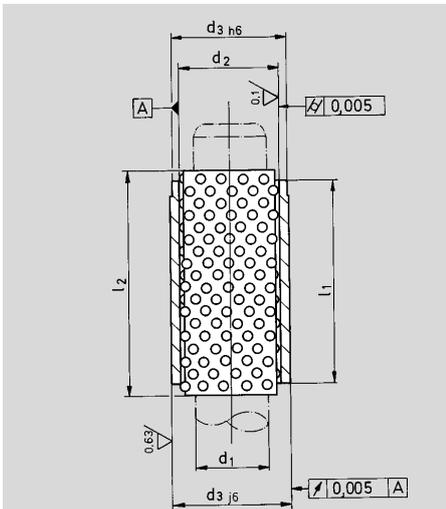

1. Glue into the bore hole ISO H6.
(Bonding agents under section 6)
2. If possible, avoid press fit, because the internal diameter will decrease.

Guide bushes ST 7412, ST 7416

with shoulder, ball guide aluminium

STEINEL[®]
NORMALIEN

Material:

Guide bushes made of steel 1.3505 (16 MnCr5) case hardened,
hardness 61-63 HRC
Ball cage made of aluminium
balls made of steel, hardened, grade 1, sorted

Guide diameter honed, suitable to ball cage and guide pillar.
Mounting diameter ISO js4, ground.

Important: If possible, order the complete ball guide, so that it can be matched with the correct fit

Matching Guide pillars:

ST 7100, ST 7106, ST 7107, ST 7108, ST 7120, ST 7126, ST 7127, ST 7128 and ST 7181/82

Mounting instructions:

Fit in mounting bore hole ISO H6.
Fix with 3 holding clamps (included in delivery).
The shoulder surface, right-angled ground to the guide bore, will be squeezed onto the plate by the holding clamps and guarantees an absolutely rigid clamping of the guide bush.

Holding clamps:

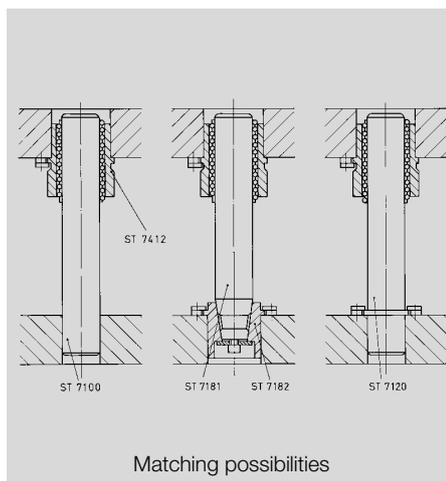

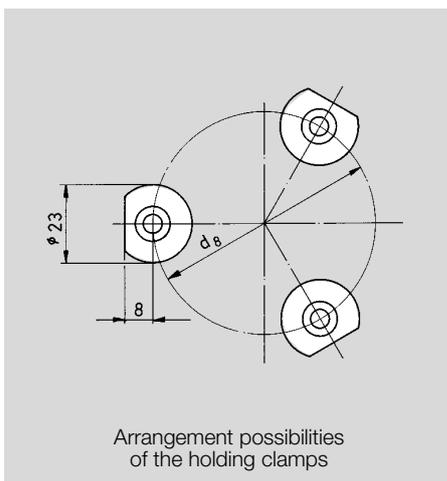

When reordering the holding clamps please order: 1 set = 3 pieces, order number ST 7367

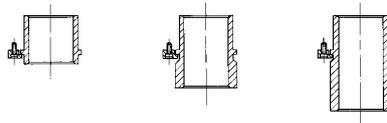

Guide bush without ball cage ST 7416
Ball cage only ST 7130

Guide bushes ST 7415

with shoulder, ball guide plastic

STEINEL[®]
NORMALIEN

Material:

Guide bushes made of steel 1.7131 (16MnCr5).
Case hardened, hardness 61-63 HRC.
Ball cage made of plastic.
Balls made of steel, hardened, grade 1, sorted.

Guide diameter honed, matched to ball cage and guide pillar.
Mounting diameter ground ISO js4.

Important: If possible, order the complete ball guide so that it can be matched with the correct preload.

Matching guide pillars: ST 7100, ST 7106, ST 7107, ST 7108, ST 7120, ST 7126, ST 7127, ST 7128 and ST 7181/82

Mounting instructions:

Fit in mounting bore hole to ISO H6.
Fasten with 3 clamps ST 7367, included in delivery. The shoulder surface is right-angled ground to the guide bore and pressed into the base plate. It is held by the clamps, which provide a rigid mounting of the guide bush.

Clamps:

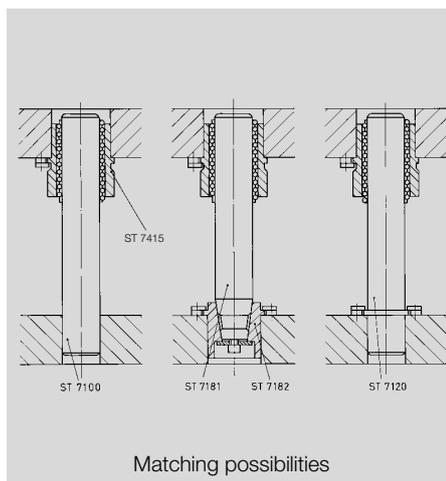

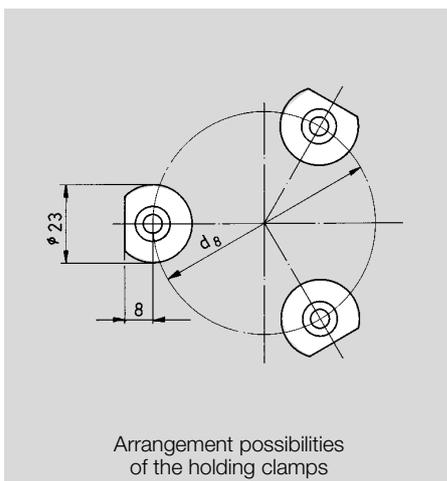

When reordering the clamps, please order: 3 pieces per guide bush, order number ST 7367

Guide bushes ST 7419

with shoulder, sliding guide steel bronze plated

STEINEL[®]
NORMALIEN

Material:

Guide bush made of steel 1.7131 (16 MnCr5), case hardened, hardness 61-63 HRC, sliding surface bronze plated.

Guide diameter ISO H5 honed
mounting diameter ISO js4, ground.

Important: Due to the galvanically applied bronze plating onto the hardened steel jacket, this bush is suitable especially for high sliding speeds and strong lateral forces.

Lubrication

Lubrication by funnel grease nipple
Connection M 8 x 1 provided for central lubrication.

Matching Guide pillars:

ST 7100, ST 7106, ST 7107, ST 7108, ST 7120, ST 7126, ST 7127, ST 7128 and ST 7181/82

Mounting instructions:

Fit in mounting bore hole ISO H6.
Fix with 3 holding clamps ST 7367 (included in delivery).
The shoulder surface, right-angled ground to the guide bore, will be squeezed onto the plate by the holding clamps and guarantees an absolutely rigid clamping of the guide bush.

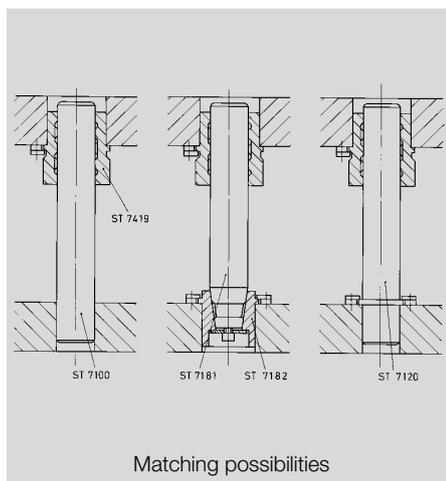

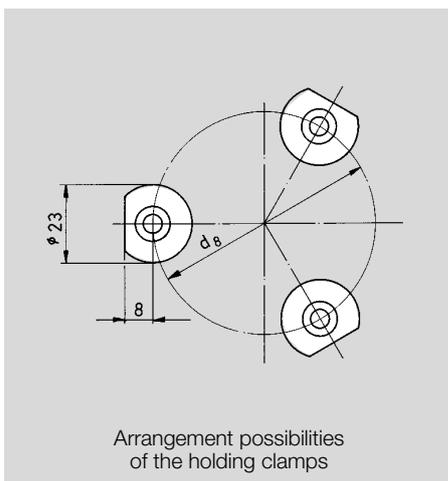

Holding clamps:

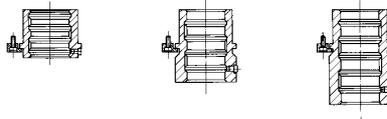

When reordering the holding clamps please order: 1 set = 3 pieces, order number ST 7367

Guide bushes ST 7471

with shoulder, sliding guide with solid lubricant

Material:

Steel with insert of solid lubricant.

Due to the solid lubricant inserts, the sliding guide is self-lubricating and is suited for higher loads.

Guide diameter ISO H6, precision turned.
Mounting diameter ISO js4, precision turned.

Lubrication:

The solid lubricant greasing will be described as a lubricating status by which solid lubricant particles, which have a low shearing resistance within their crystal structure, are available between two surfaces and taking over the lubricating functions.

Matching Guide pillars:

ST 7100, ST 7106, ST 7107, ST 7108, ST 7120, ST 7126, ST 7127, ST 7128 and ST 7181/82

Mounting instructions:

Fit in mounting bore hole ISO H6.
Fix with 3 holding clamps ST 7367 (included in delivery).

The shoulder surface, right-angled ground to the guide bore, will be squeezed onto the plate by the holding clamps and guarantees an absolutely rigid clamping of the guide bush.

Guide bushes ST 7431

with shoulder, sliding guide with solid lubricant

Material:

Bronze with solid lubricant bands.

Due to the solid lubricant bands, the sliding guide is self-lubricating and suitable for higher loads.

Guide diameter ISO H6, precision turned
Mounting diameter ISO j6, precision turned

Lubrication:

In the solid lubricant construction, the particles of the solid lubricant have a low shearing resistance in their crystalline structure. They are between two surfaces and take over the lubricating function.

Matching guide pillars:

ST 7100, ST 7106, ST 7107, ST 7108, ST 7120, ST 7126, ST 7127, ST 7128 and ST 7181/82

Mounting instructions:

Fit in mounting bore hole to ISO H6.
Fasten with 3 clamps ST 7367, included in delivery. The shoulder surface is right-angled ground to the guide bore and pressed into the base plate. It is held by the clamps, which provide a rigid mounting of the guide bush.

Clamps:

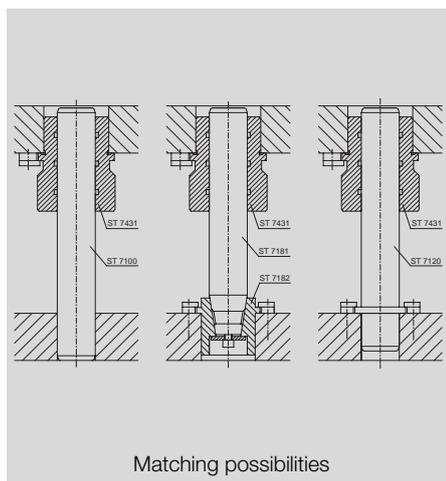

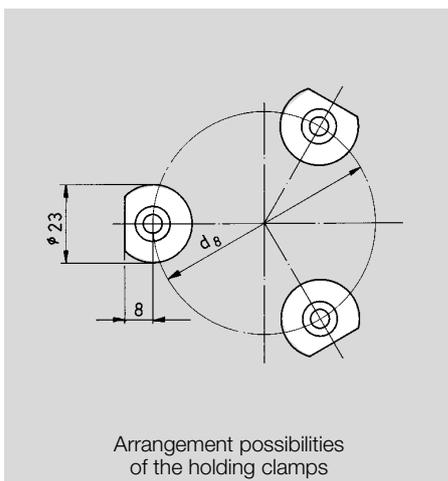

When reordering the clamps, please order: 3 pieces per guide bush, order number ST 7367

Guide bushes ST 7422, ST 7426

with flange, ball guide aluminium

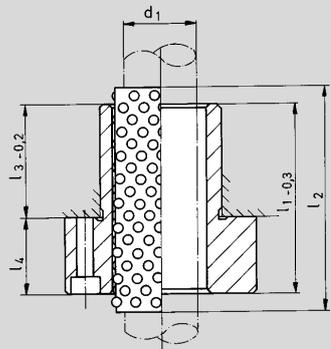

STEINEL[®]
NORMALIEN

Short version

Mid-length version

Long version
Cage travel = 1/2 length of stroke

Material:

Guide bush made of steel 1.7131 (16 MnCr5) case hardened, hardness 61-63 HRC.
ball cage made of aluminium,
balls made of steel, hardened, grade 1, sorted.

Guide diameter d_2 honed, suitable to ball cage and guide pillar.
Mounting diameter ISO js4, ground.

Important:

If possible, order the complete ball guide, so that it can be matched with the correct fit

Matching guide pillars:

ST 7100, ST 7106, ST 7107, ST 7108, ST 7120, ST 7126, ST 7127, ST 7128 and ST 7181/82

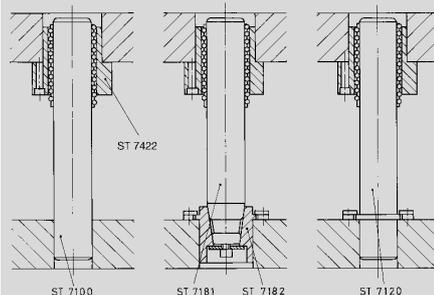

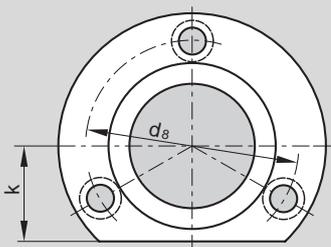

Mounting instructions:

Fit in mounting bore hole ISO H6.
Fix with 3 cheese-head screws (like our SZ 8510, not included).
The flange surface, right-angled ground to the guide bore, will be squeezed onto the plate by the screws and guarantees an absolutely rigid clamping of the guide bush.

Guide bushes ST 7424

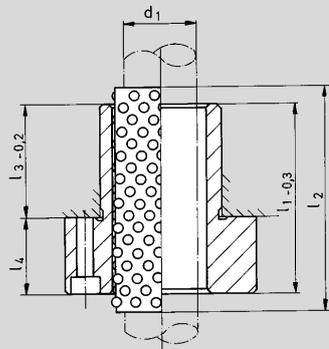

with flange, ball guide brass

Short version

Mid-length version

Long version
Cage travel = 1/2 length of stroke

Material:

Guide bush made of steel 1.7131 (16 Mn Cr5) case hardened, hardness 61-63 HRC.
Ball cage made of brass,
balls made of steel, hardened, grade 1, sorted.

Guide diameter honed, suitable to ball cage and guide pillar.
Mounting diameter ISO js4, ground.

Important:

If possible, order the complete ball guide, so that it can be matched with the correct fit

Matching Guide pillars:

ST 7100, ST 7106, ST 7107, ST 7108, ST 7120, ST 7126, ST 7127, ST 7128 and ST 7181/82

Mounting instructions:

Fit in mounting bore hole ISO H6.
Fix with 3 cheese-head screws (like our SZ 8510, not included).

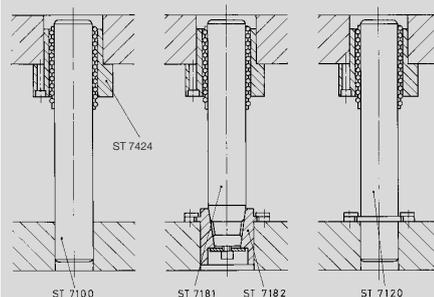

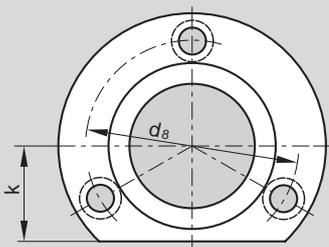

The flange surface, right-angled ground to the guide bore, will be squeezed onto the plate by the screws and guarantees an absolutely rigid clamping of the guide bush.

Guide bushes ST 7425

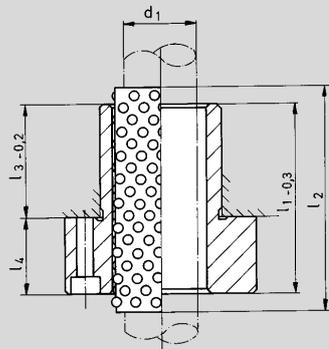

with flange, ball guide plastic

Short version

Mid-length version

Long version
Cage travel = 1/2 length of stroke

Material:

Guide bushes made of steel 1.7131 (16 Mn Cr5) case hardened, hardness 61-63 HRC.
Ball cage made of plastic,
balls made of steel, hardened, grade 1, sorted.

Guide diameter honed, matched to ball cage and guide pillar.
Mounting diameter ground to ISO js4.

Important:

If possible, order the complete ball guide so that it can be matched with the correct preload.

Matching guide pillars:

ST 7100, ST 7106, ST 7107, ST 7108, ST 7120, ST 7126, ST 7127, ST 7128 and ST 7181/82

Mounting instructions:

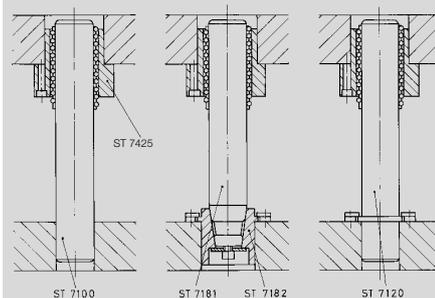

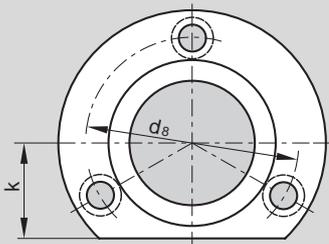

Fit in mounting bore hole to ISO H6.
Fasten with 3 socket-head cap screws.
The shoulder surface is right-angled ground to the guide bore and pressed into the base plate. It is held by the clamps, which provide a rigid mounting of the guide bush.

Guide bushes ST 7429

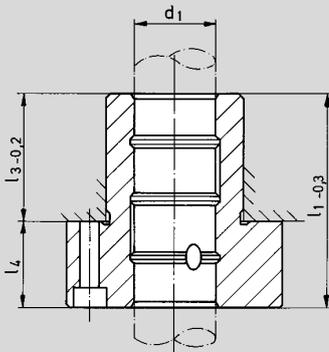

with flange, sliding guide steel bronze plated

Short version

Mid-length version

Long version

Material: steel 1.7131 (16 Mn Cr5)
case hardened, hardness 61-63 HRC
sliding surface bronze plated

Guide diameter ISO H5, honed
mounting diameter ISO js4, ground.

Important: Due to the galvanically applied bronze plating onto the hardened steel jacket, this bush is suitable especially for high sliding speeds and strong lateral forces.

Lubrication

Lubrication by funnel grease nipple
Connection M 8 x 1 provided for central lubrication.

Matching Guide pillars:

ST 7100, ST 7106, ST 7107, ST 7108, ST 7120,
ST 7126, ST 7127, ST 7128 and ST 7181/82

Mounting instructions:

Fit in mounting bore hole ISO H6.
Fix with 3 cheese-head screws (like our SZ 8510,
not included).

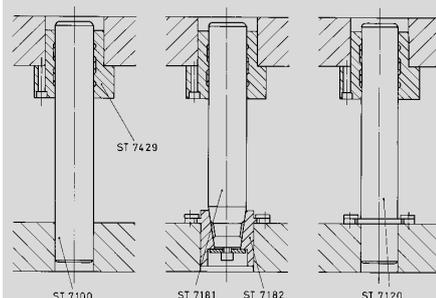

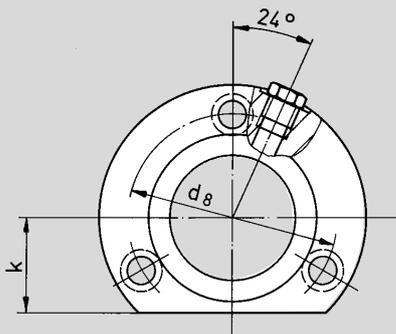

The flange surface, right-angled ground to the
guide bore, will be squeezed onto the plate by
the screws clamps and guarantees an absolutely
rigid clamping of the guide bush.

At dia. 15 and 16 the bore hole for lubrication is at
the shank d₃.

Guide bushes ST 7481

with flange, sliding guide with solid lubricant

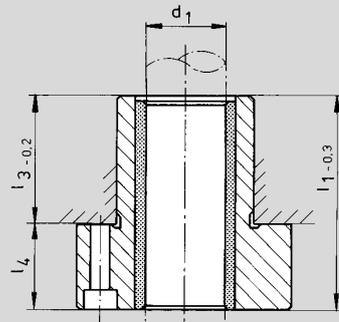

STEINEL[®]
NORMALIEN

Short version

Mid-length version

Long version

Material:

Steel with insert of solid lubricant

Due to the solid lubricant inserts, the sliding guide is self-lubricating and is suited for higher loads.

Guide diameter ISO H6, precision turned.
Mounting diameter ISO js4, precision turned.

Lubrication:

The solid lubricant greasing will be described as a lubricating status by which solid lubricant particles, which have a low shearing resistance within their crystal structure, are available between two surfaces and taking over the lubricating functions.

Matching Guide pillars:

ST 7100, ST 7106, ST 7107, ST 7108, ST 7120, ST 7126, ST 7127, ST 7128 and ST 7181/82

Mounting instructions:

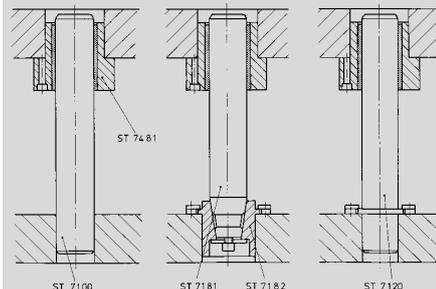

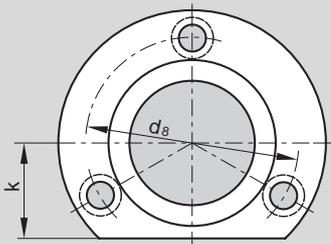

Fit in mounting bore hole ISO H6.
Fix with 3 cheese-head screws (like our SZ 8510, not included).

The flange surface, right-angled ground to the guide bore, will be squeezed onto the plate by the screws clamps and guarantees an absolutely rigid clamping of the guide bush.

(included).

Guide plates ST 7571

with solid lubricant

VDI 3357

Material: bronze with solid lubricant

Attachement

Suitable hexagon socket screws DIN 912
Order number **SZ 8510.12 x 025**

Order example: guide plate ST 7571

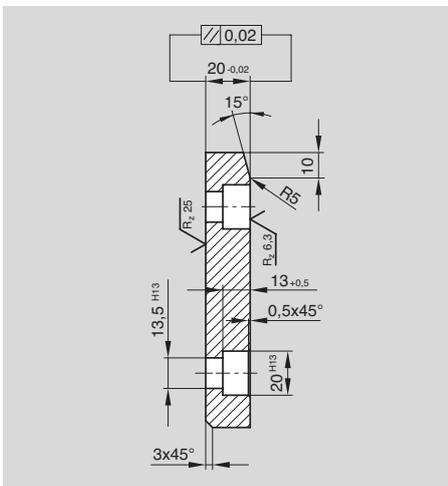

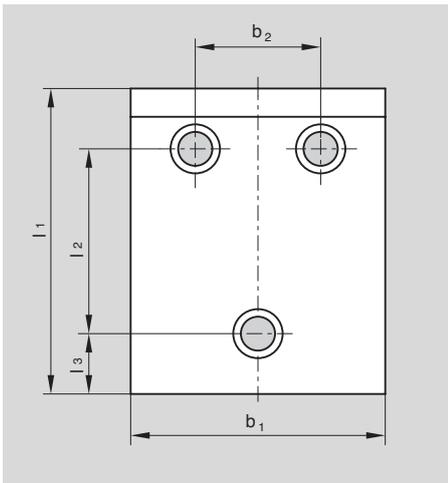

Size $b_1 \times l_1 = 80 \times 125$
Add **080 x 125**
Order number **ST 7571.080 x 125**

Function:

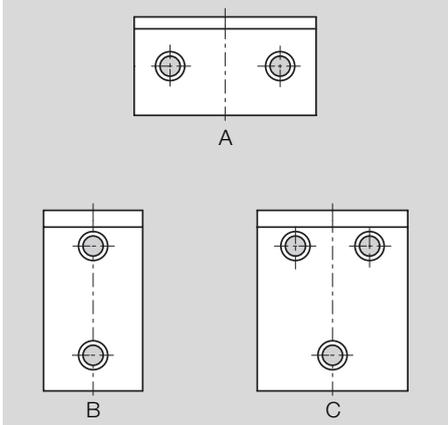

Guide plates will preferably be used when moving within the limits of mixed friction or solid-state friction, that means, with very low sliding speeds and high specific surface pressures.

They are insensible against impacts and pushes and have very good wearing properties.

Due to the integrate solid lubricant inserts the sliding guide is self-lubricating and for that reason without maintenance.

Cutting units with titane-nitride coating

TiN-coated tools

to increase the efficiency and profitability of your punching and deform tools.

TiN-coated tools

are manufactured out of the base metal HSS or Vanadis 23 Superclean and coated with titane-nitride (gold-coloured).

TiN-coated tools increase

- the surface hardness toward 2 fold
- service life towards 3-7 fold
- wear resistance
- the temperature resistance
- the corrosion resistance
- the surface finish quality

TiN-coated tool reduce

- the setup periods
- the costs of repair
- the costs of production
- the costs of regrinding
- the cold fusing
- the retraction forces

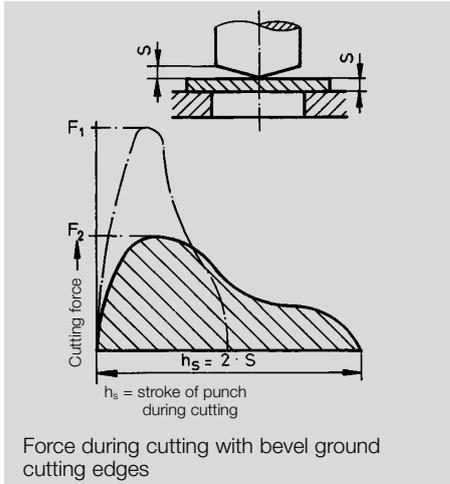

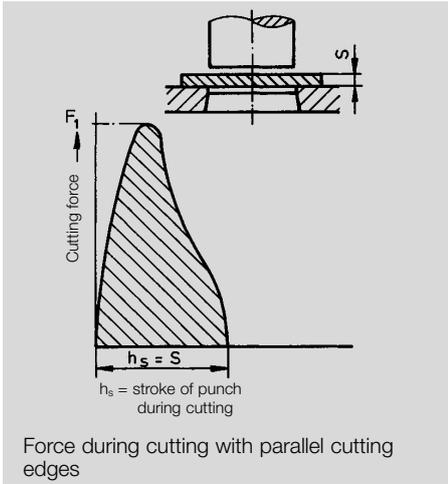

Method characteristics

Coating: Hard-material compound of titane and nitrogen according to the PVC-method

Thickness of coat: 2-3 µm
Coating temperature: about 500 °C
Hardness of coat: 2200-2600 HV

Cutting forces

Shearing strengths

Forces during the cutting

Following factors influence the size of the cutting force: Length, location and condition of the cutting edges of punch and matrix, thickness and material (shearing strength) of the parts, which have to be cut, cutting clearance.

The stripping force can be assumed with sufficient accuracy to be 10% of the cutting force F_1 , respectively F_2 .

The following diagram is of use to determine the cutting area and cutting force quickly

Parallel ground cutting edges

If the cutting edges of punch and die are parallel, the cutting force will be calculated in the following way:

$$F_1 = k_s \cdot L \cdot s \quad (\text{N})$$

k_s = shearing strength (N/mm²)
 L = length of cutting edges (mm)
 s = sheet thickness (mm)

Bevel ground cutting edges

The cutting force can be considerably reduced by bevel grinding or cylindrical grinding on punch or die. Depending on type of edges, the cutting force will be reduced to 0,5 – 0,67 · F_1 .

$$F_2 = 0,67 k_s \cdot L \cdot s \quad (\text{N})$$

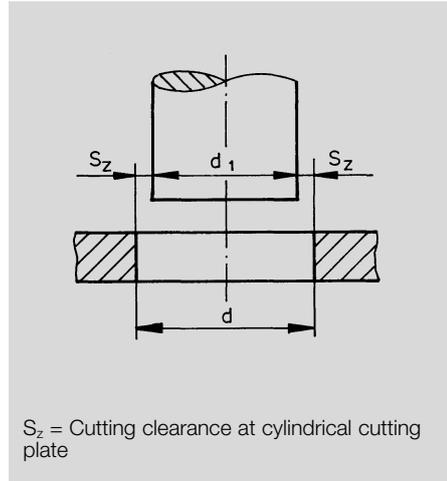

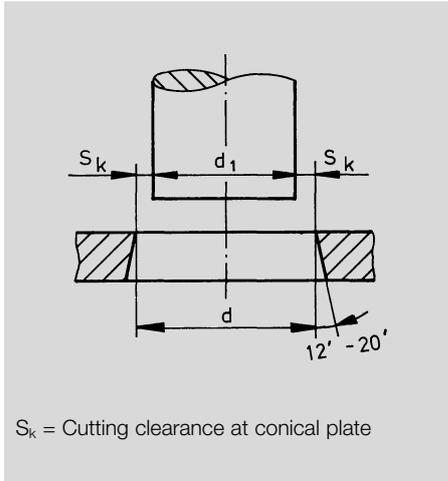

Steel	Non-ferrous metals		Non-metals

	V 2A	500-600	Silver	280		

Shearing strength

of different materials k_s in N/mm²

Cutting clearance

Location of the strip

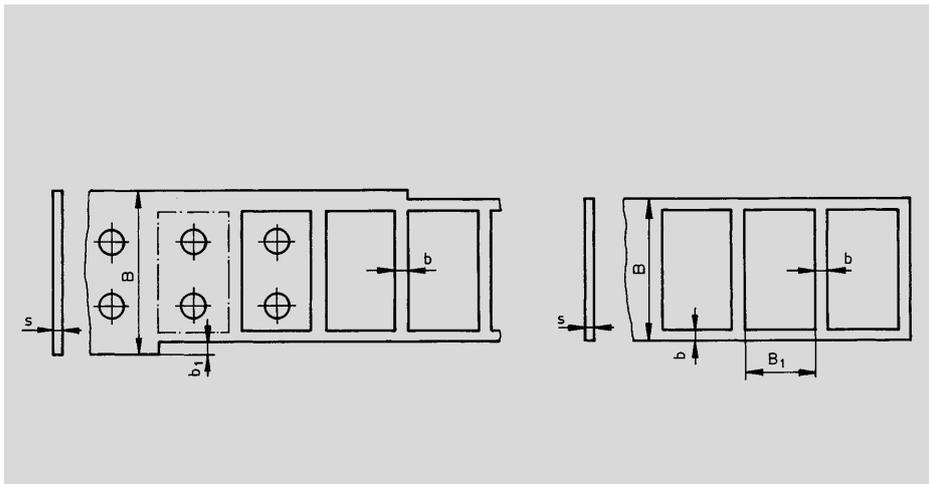

Cutting split

The size of the cutting split is depending on the thickness of the sheet s and on the shearing strength k_s of the metal.

Punch clearance $S_p = 2 \times S_k$ respectively S_z or $S_p = d - d_1$

Determinative for the dimension sizes of the workpiece are: during cutting out, the rupture of the cutting plate, during punching, the piercing punch.

Location of the strip, gauges of edges and crosspieces

With an optimum location of the cutouts in the strip, the discard can be reduced most. At some forms of workpieces, cutting without crosspieces or even without any discard is possible. This result can be obtained with small corrections at the outside form of the workpiece.

Example: Cutting out of round sheet bars
 in one row: 30% discard
 in two rows: 20% discard
 in three rows: 17% discard

Sheet thickness s Nominal size (mm)		0,2	0,25	0,3	0,35	0,4	0,5	0,6	0,7	0,8	0,9	1,0	1,2	1,5	2,0	2,5	3,0	3,5	4,0	4,5	5,0

Table of diagram to determine the cutting clearance as well as gauge of edge and crosspiece

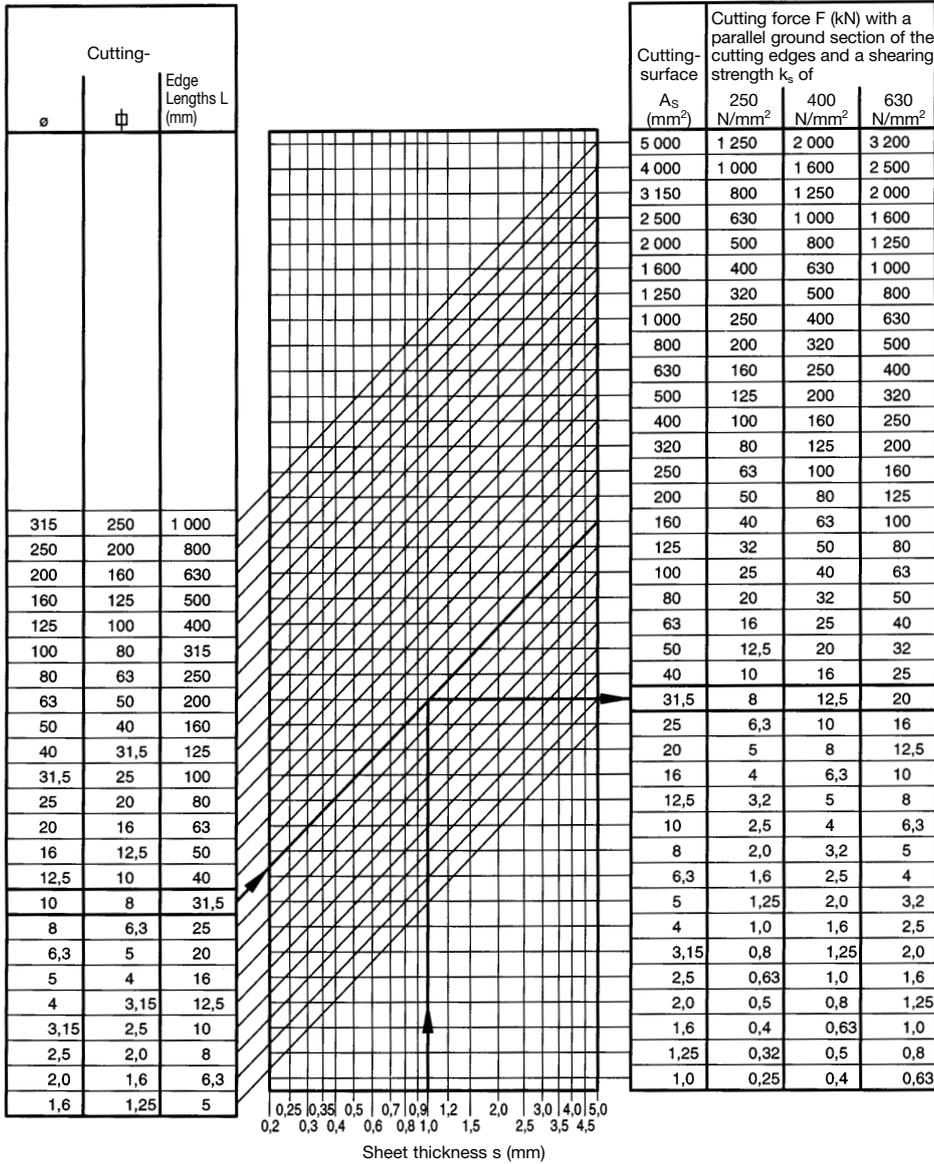

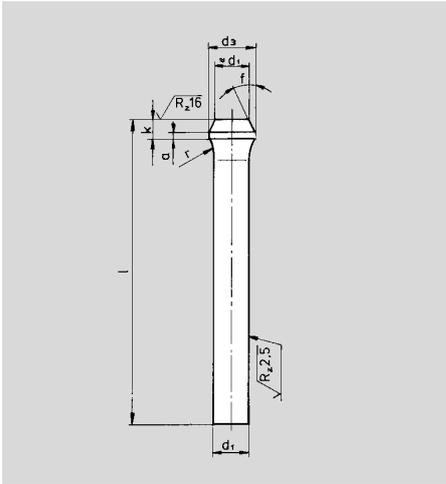

Diagramm to determine the cutting surface and the cutting force

Example: With a length of cutting edges $l = 31,5$ mm (corresponding cutting diameter 10 mm or $\Phi 8$ mm) and a sheet thickness $s = 1$ mm the cutting surface $A_s = 31,5$ mm. At parallel ground cutting edges and a shearing strength $k_s = 400$ N/mm² there will result a cutting force $F_1 = 12,5$ kN (1250 kp).

Round cutting punches with trumpet throat and straight shank

Form D

Precision finish

Head and shank are puncture-polished after hammering

Order example: Round cutting punch with trumpet throat and straight shank in HSS
SZ 6149

Special cutting units

Precision cutting punches

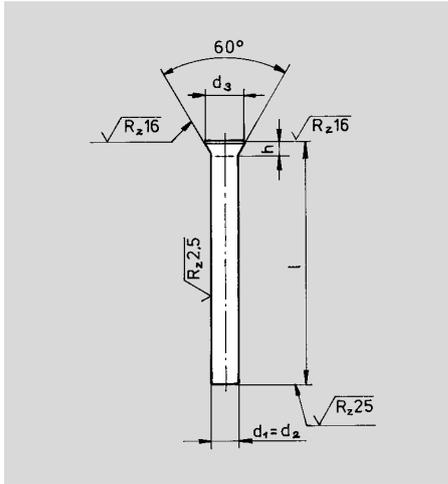

Precision cutting bushes

Special cutting units can be manufactured according to your specifications and drawings in the following materials HWS, HSS, CPM and Vanadis 23 Superclean.

All sizes in HSS, CPM and Vanadis 23 Superclean can be supplied with the following coatings: TIN, TIC, TiCN or TiC/TiN.

You can reach us at +49 (0) 77 20/6928 17 or you can fax your request to +49 (0) 77 20/692870.

Round cutting punches with conical head and straight shank

DIN 9861, Form D, ISO 6752

Precision finish

Head and shank are puncture-polished after hammering

Indication: All dimension sizes in HSS, CPM and Vanadis 23 Superclean are available short dated with TIN-coating too.

Cutting punches

Round cutting punches with pressure pin, cylindrical head and recessed shank

ISO 8020, Form F

Precision finish

Indication: All dimension sizes in HSS and CPM are available short dated with TIN-coating too

Order example: Cutting punch with pressure pin, cylindrical head and recessed shank in HSS **SZ 5906**

$d_1 = 2,7 \text{ mm}$, $d_2 = 6,0 \text{ mm}$, length 80 mm

Add **027 x 080**

Order number **SZ 5906.027 x 080**

Time of delivery upon request

CPM powder metallurgical
high precision steel
shank hardness HRC 62 ± 2
head hardness HRC 50 ± 5

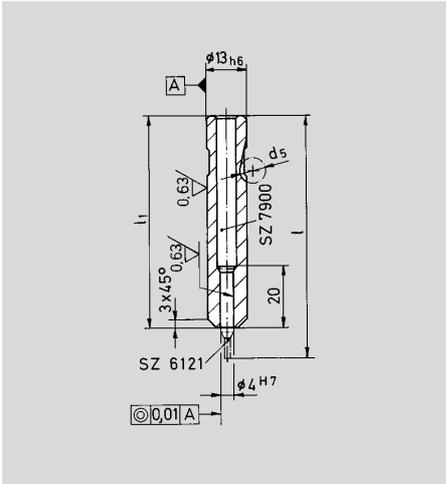

HSS high performance
high speed steel
shank hardness HRC 64 ± 2
head hardness HRC 50 ± 5

Receiving plates

Polygonal holding plate for quick-change cutting elements

Material: Stamp plate 1.0401 (C 15) case hardened, hardness HRC 58-60
Press plate 1.1750 (C 75 W 3) hardened, hardness HRC 60-62

Cylinder pins with internal threading SZ 7905

Order example: Polygonal holding plate for quick-change cutting units **SZ 5470**
 $d_2 = 16$ mm
Add **16**
Order number **SZ 5470.16**

Characteristics:

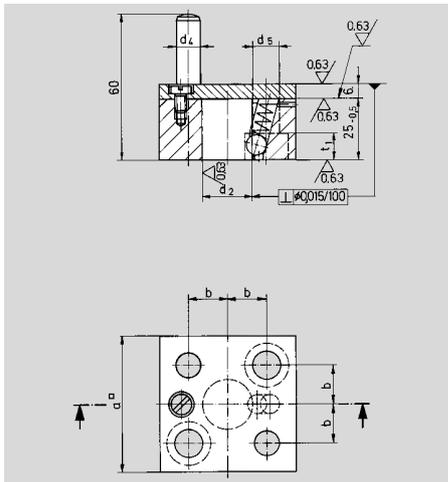

The stamp receiver bore d_2 is prepared for the pin bores 6 G6 with a precision of ± 0.0005 mm. This guarantees the interchangeability of the holding plate with other polygonal products.

Receiving plates square for quick-change cutting units centric mounting borehole

Material: Punch plate 1.0401 (C 15) case hardened, hardness HRC 58-60
Press plate 1.1750 (C 75 W 3) hardened, hardness HRC 60-62

Cylinder pins with internal threading SZ 7905

Order example: Receiving plate square for quick-change cutting units, centric mounting borehole **SZ 5410**
 $d_2 = 20$ mm
Add **20**
Order number **SZ 5410.20**

Execution

The punch mounting borehole d_2 will be manufactured with precision of ± 0.0005 mm to the pin boreholes. Therefore the interchangeability of receiving plate is guaranteed.

Add size to order number

Form cutting bushes with shoulder, rectangular, with protection against torsion

DIN/ISO 8977

Material: HWS high performance tool steel

12% CR

hardness HRC 60-62

Price and time of delivery upon request

Dimension a x b free at choice, diagonal dimension max. $d_4 = 1,0$ mm

Indication: When matching punch and bush pay attention to the cutting clearance

Order example: Form cutting bush with shoulder, rectangular **SZ 6392**

$d_2 = 25$ mm, $a = 5,5$ mm, $b = 12,5$ mm,

$l_1 = 32$ mm, $\alpha = 90^\circ$

Add **25.055 x 125 x 32.90**

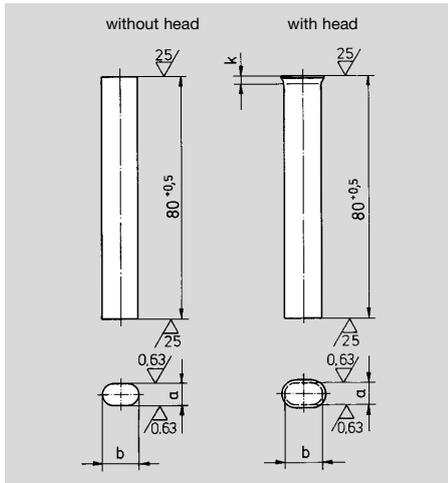

Order number **SZ 6392.25.055 x 125 x 32.90**

Add size to order number

Order number **SZ 6392. . x x .**

Length 32 upon request

Cutting bushes for press fitting, with shoulder, round, with start bore

Material: HWS high performance tool steel
12% CR, hardness HRC 60-62

Indication: Suitable for wire-eroding for different forms.

Same outside diameters as punch guide SZ 6225 and punch bushing SZ 6285 (ISO 8978 and ISO 8977).

Order example: Cutting bush for press fitting, with shoulder, round, with start bore

SZ 6286

Strippers for cutting punches, self-retaining

Material: Vulkollan
Polyurethan-Elastomer (PUR)
on the base of Desmodur 15
hardness: 90 ± 5 Shore A

Stripper length l_0
The stripper length l_0 in the table are a proposal range harmonized onto the standard sizes of cutting punches and receiving plates. Beyond we supply every immediate length without any additional costs.

For other sizes of cutting punches and receiving plates the stripper length will be determined as follows:

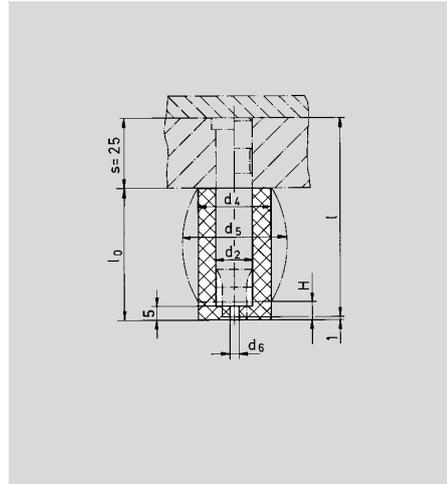

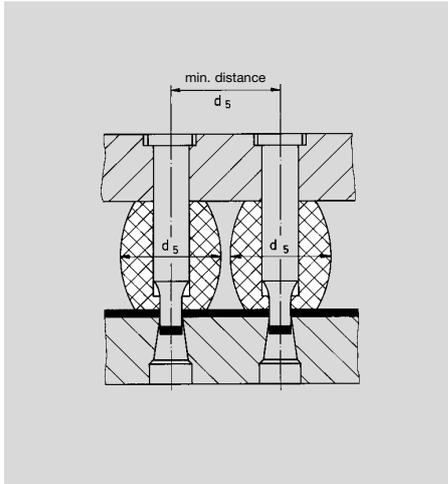

$$l_0 = l - s + 1$$

Order example: Punch length $l = 71$ mm
Thickness of the receiving plate $s = 25$ mm
 $l_0 = 71 - 25 + 1 = 47$ mm

Add size to order number

Order number **SZ 8455**. x

Mounting indications

Due to the axial compression of the stripper during the cutting process, there results a bulging out of the external diameter, d_4 onto the size d_5 (see table).

Therefore enough volume for the bulging out must be provided for.

Fitting: Place upside down by hand over fitted cutting punch. Stripper adheres, due to its elasticity tight to the punch. Operate the press empty for one stroke, so that the punch perforates the bottom of the stripper in the correct size.

Ready for use!

As the stripper sits tight to the cutting shank, because it was perforated by the punch itself, the indentation of the sheet between cutting punch and stripper, also of small sheets, will be prevented.

The stripper moreover raises the kink rigidity of the cutting punch, because punch shank and cutting shank will be encircled by the stripper free from play.

Order example: Stripper for cutting punch, self retaining **SZ 8455**

$d_2 = 13 \text{ mm}$, $l_0 = 47 \text{ mm}$

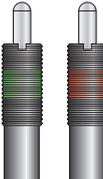

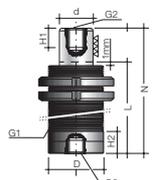

Add **13 x 47**

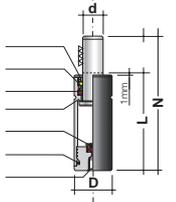

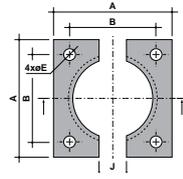

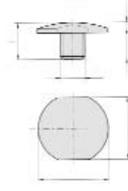

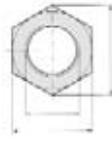

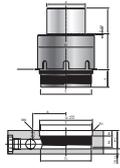

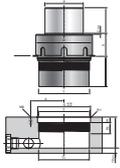

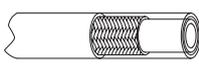

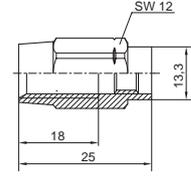

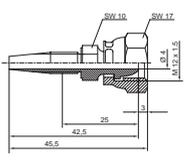

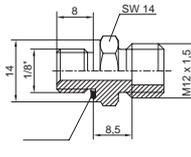

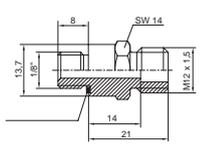

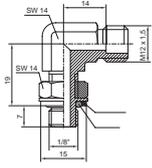

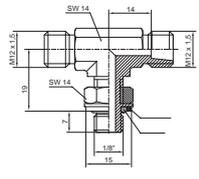

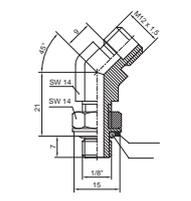

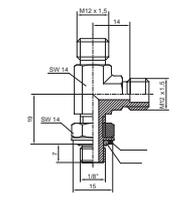

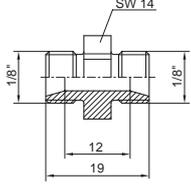

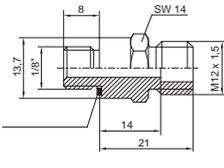

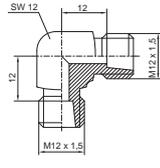

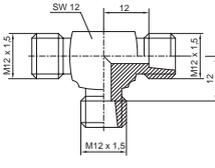

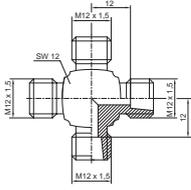

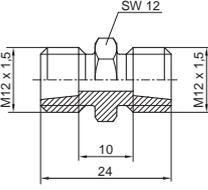

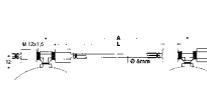

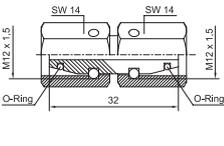

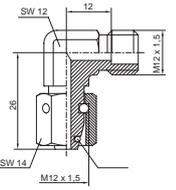

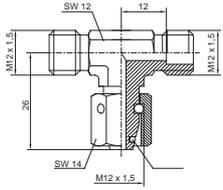

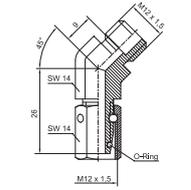

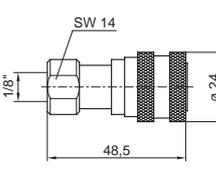

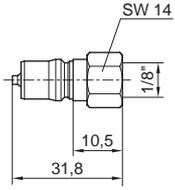

Order number **SZ 8455.13 x 47**

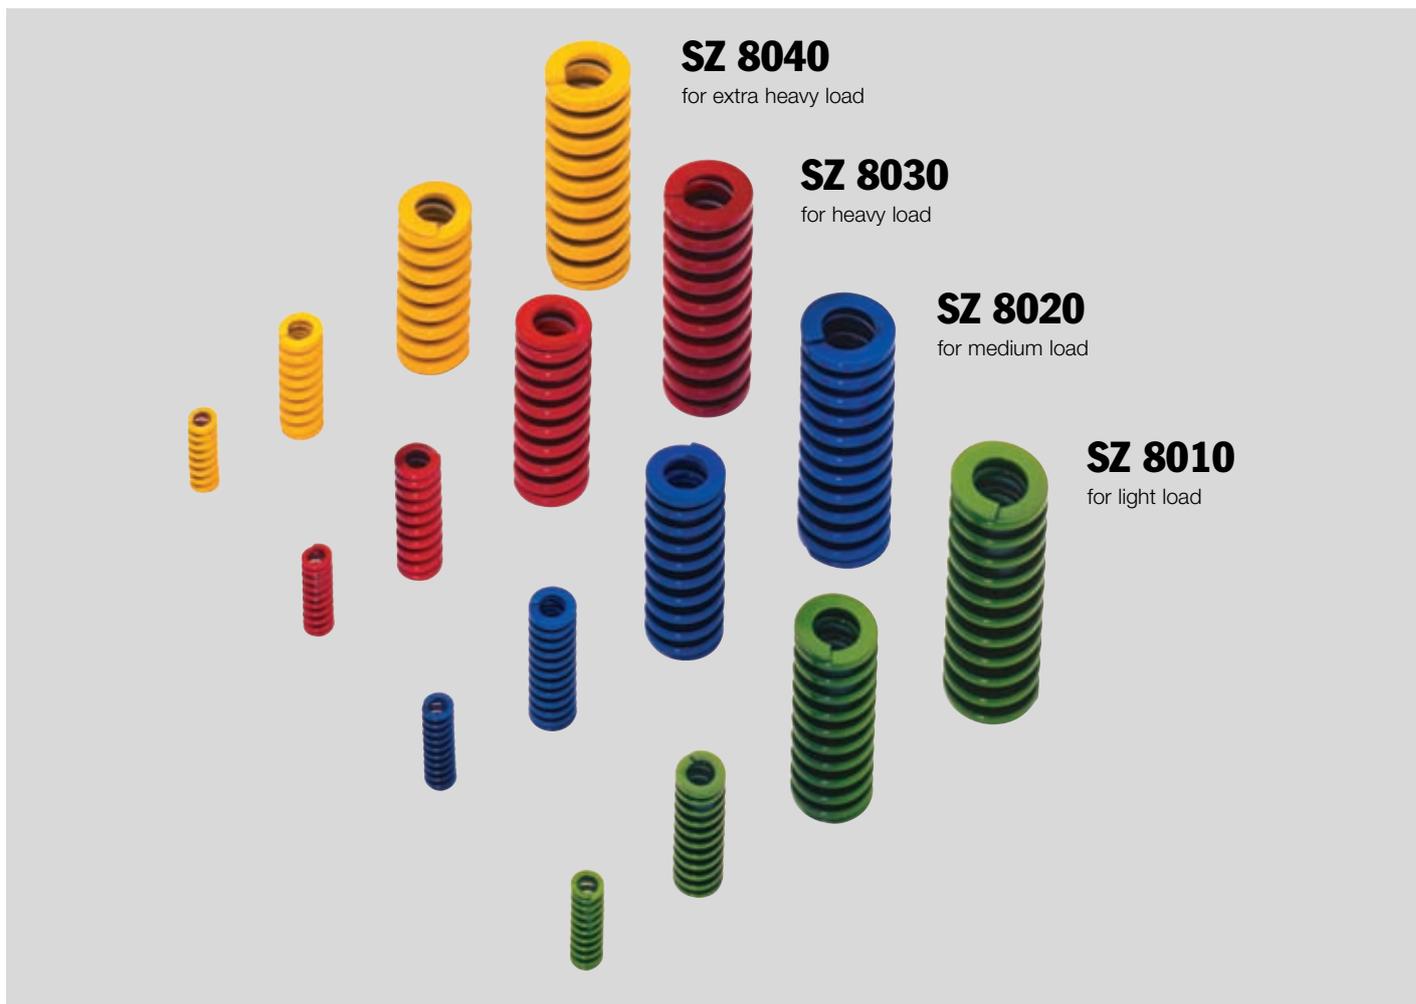

Springs

- Helical springs with round, square and flat bottom cross section
- Disc springs
- Rubber springs
- Plastic springs
- Springy thrust pieces
- Polyurethane plates and rods for example for metal deformation
- System springs
- System spring units

Helical compression springs in four types of load

The system springs made of profiled valve-spring steel wire are available in four load types. Each of these four helical compression springs has got the same assembling dimensions, so that an increase respectively a reduction of compressive forces can ensue without any problems, also subsequently.

For immediate distinction the system springs are characterized by different colours and therefore can quickly be allocated to the respective type of load.

Ascending part numbers also mean ascending loads of the system springs, so it is only necessary to add the tube diameter (D_h) x of the unloaded spring length (L_0).

Order number	Types of load	Ident. colour
SZ8010. $D_h \times L_0$	light load	green
SZ8020. $D_h \times L_0$	medium load	blue
SZ8030. $D_h \times L_0$	heavy load	red
SZ8040. $D_h \times L_0$	extra heavy load	yellow

ISO 10243

Assembling dimensions – basic sizes

The STEINEL system springs are available in nine basic sizes with the following tube diameters (D_h) and rod diameters (D_d):

D_h/D_d	D_h/D_d	D_h/D_d
10/5	20/10	40/20
12,5/6,3	25/12,5	50/25
16/8	32/16	63/38

The assembling lengths of the unloaded springs (L_0) base on inch sizes according to 25 – 254 mm.

For all basic sizes there are 305 mm long springs available, too, which can be shortened as occasion demands.

Material

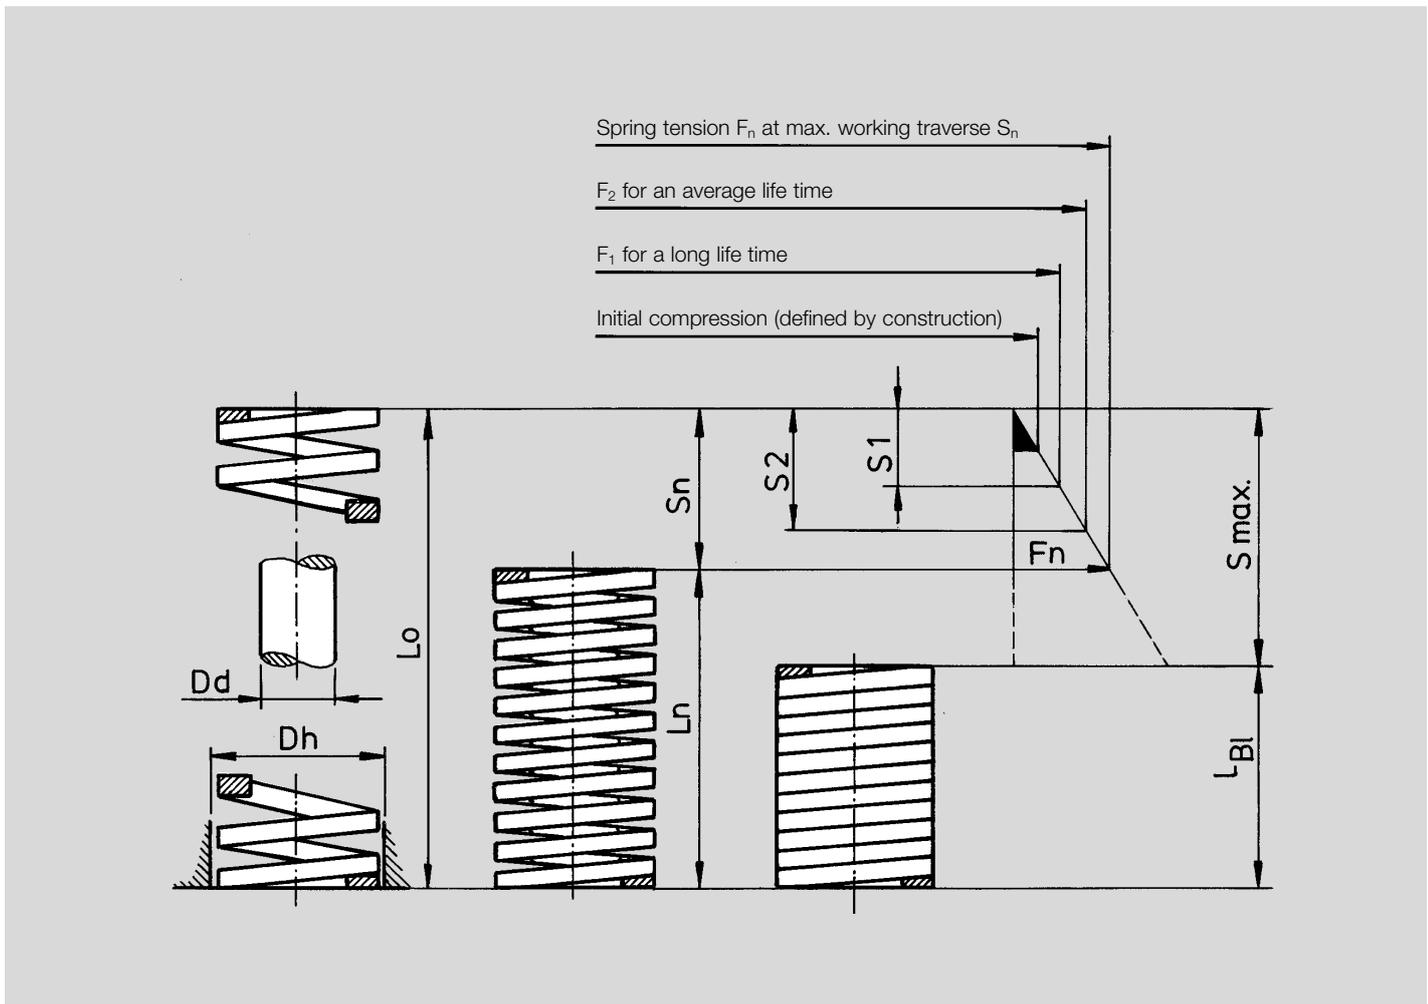

All springs are made of alloyed valve-spring steel wire (Cr-V/CR-Si). This wire is especially resistant against heat and vibration strains. Moreover this quality can also be used for higher temperature ranges up to 230 °C.

Manufacturing process and testing method

All springs are subject to special heat treatments, shot peened and initial-loaded. Thereby tensions are eliminated, to get a high fatigue limit.

The ends of the springs are closed and ground square with parallel faces.

The springs are subjected to strict quality checks, with vibration trials additional tests ensue concerning the working life.

Legend of the dimension symbols

- D_h = tube diameters (outward guiding) in mm
- D_d = rod diameter (internal guiding) in mm
- L_0 = length of the unloaded spring
- c = spring coefficient in N/mm
(spring tension causing spring strokes in mm)
- $s_1 - s_n$ = travel strokes in mm
caused to the spring tensions $F_1 - F_n$
- $F_1 - F_n$ = spring tensions in N
caused to the travel strokes $s_1 - s_n$
- L_n = minimal allowable length of the loaded spring ($L_0 - s_n$)
caused to the spring tension F_n
- S_{max} = maximal travel stroke in mm
- L_{BI} = block length of compacted spring ($L_0 - s_{max}$)

Tolerances for the length of the unloaded spring, L_0

L_0 mm $\pm 3\%$	L_0 mm $\pm 2,5\%$	L_0 mm $\pm 2\%$
25	76	127
32	89	139
38	102	152
44	115	178
51		203
64		254
		305

Constructional directives for selection

- priority the stroke
- priority the spring tension
- priority the working life

Note:

It is not allowed to exceed the travel stroke s_n (max. working traverse) and the resulting spring tension F_n , listed in the table.

Every spring should by principle be pre-loaded, because natural vibrations and push shock stresses of an unloaded spring reduce the working life.

Every spring has to be guided by an outward guiding (D_h) and/or an internal guiding (D_d). A rule of thumbs is: The crevasse depth of counterboring respectively the rod length should amount at minimum to 2 – 3 windings of the spring. The longer the spring, the longer the guiding.

Constructively it should always be aimed at a long working life of the springs. Therefore, the spring should preferable be chosen acc. to the travel stroke s_1 and the resulting spring tension F_1 .

Travel stroke symbols

- S_1 = long working life
- S_2 = average working life
- S_n = max. working traverse
- S_{max} = max. travel stroke

System springs

Quick review

Helical compression springs in four groups

Material: profiled valve-spring steel wire (Cr-V / Cr-Si)

The springs are initial-loaded, the ends are closed and ground square parallel.

Important characteristics data:

D_h = tube diameter in mm

L_0 = length of the unloaded spring in mm

c = spring coefficient in N/mm (spring tension causing spring strokes in mm)

System springs SZ 8005

for extra light load, colour purple

STEINEL[®]
NORMALIEN

Helical compression springs for extra light load

Material: Profiled valve-spring steel wire (Cr-V / Cr-Si)

Tolerances similar to DIN 2095

The springs are initial-loaded, the ends are closed and ground square parallel.

Order example: System spring for extra light load **SZ 8005**

$D_h = 25 \text{ mm}$, $L_0 = 76 \text{ mm}$

Add **25 x 076**

Order number **SZ 8005.25 x 076**

Add size to order number

Order number **SZ 8005.** x

System springs SZ 8010

for light load, colour green

STEINEL[®]
NORMALIEN

Helical compression springs for light load

Material: Profiled valve-spring steel wire (Cr-V / Cr-Si)

Tolerances similar to DIN 2095

The springs are initial-loaded, the ends are closed and ground square parallel.

Order example: System spring for light load **SZ 8010**

$D_h = 25 \text{ mm}$, $L_0 = 76 \text{ mm}$

Add **25 x 076**

Order number **SZ 8010.25 x 076**

ISO 10243

System springs SZ 8020

for medium load, colour blue

STEINEL[®]
NORMALIEN

Helical compression springs for medium load

Material: Profiled valve-spring steel wire (Cr-V / Cr-Si)

Tolerances similar to DIN 2095

The springs are initial-loaded, the ends are closed and ground square parallel.

Order example: System spring for medium load **SZ 8020**

$D_h = 25 \text{ mm}$, $L_0 = 76 \text{ mm}$

Add **25 x 076**

Order number **SZ 8020.25 x 076**

ISO 10243

Add size to order number

Order number **SZ 8020.** x

System springs SZ 8040

for extra heavy load, colour yellow

STEINEL[®]
NORMALIEN

Helical compression springs for extra heavy load

Material: profiled valve-spring steel wire (Cr-V / Cr-Si)

Tolerances similar to DIN 2095

The springs are initial-loaded, the ends are closed and ground square parallel.

Order example: System spring for extra heavy load **SZ 8040**

$D_h = 25 \text{ mm}$, $L_0 = 76 \text{ mm}$

Add **25 x 076**

Order number **SZ 8040.25 x 076**

ISO 10243

Add size to order number

System springs SZ 8045

for extra heavy loads

STEINEL®
NORMALIEN

Screw pressure springs for extra heavy loads

Material: Profiled valve-spring steel wire (Cr-V / Cr-Si)

Tolerances similar to DIN 2095

The springs are initial-loaded, the ends are closed and ground square parallel.

Order example: System spring for extra heavy load **SZ 8045**

$D_h = 25$ mm, $L_0 = 89$ mm

Add **25 x 089**

Order number **SZ 8045.25 x 089**

Add size to order number

Order number **SZ 8045.** x

Helical springs

Helical springs with round cross section

Material: Patented drawn spring wire grade C according to DIN 17223

Efficiency rating 2 according to DIN 2095. The springs are initial loaded, 1 winding closed at both ends and ground square.

Indication: For long working life at an oscillatory loading $s_{max} = \text{about } 0,7 s_n$.

Springs with round cross section should be used preferably, because they have the most positive attributes.

Order example: Helical spiral springs with round cross section **SZ 8100**

$D_a = 46 \text{ mm}$, $l_0 = 67 \text{ mm}$

Add **46 x 67**

Order number **SZ 8100.46 x 67**

*) Helical spiral springs arranged according to forces see concerning page

Helical springs

Helical springs with round cross section, 500 mm long

Material: Patented drawn spring wire grade C according to DIN 17223

Efficiency rating 2 according to DIN 2095. The springs are initial-loaded.

Indication: For long working life at an oscillatory loading $s_{max} = ca. 0,7 s_n$.

Helical springs 500 mm long are suited for production of any spring lengths. After the cutoff of the desired length, close ends of the springs and grind rectangular to the spring axis. Avoid excessive heating during closing!

Order example: Helical springs with round cross section, 500 mm long **SZ 8101**

$D_a = 18$ mm, $d = 4$ mm

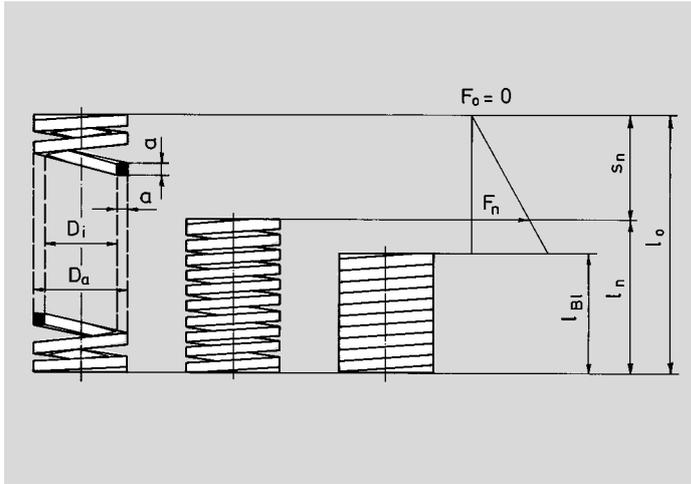

Add **18 x 4**

Order number **SZ 8101.18 x 4**

Helical springs with square cross section

Material: Patented drawn spring wire grade C according to DIN 17223.

Tolerances similar to DIN 2095. The springs are initial-loaded, 1 each winding closed at both ends and ground square.

Indication: For long working life at an oscillatory loading $s_{max} = ca. 0,7 s_n$.

The spring tension of springs with square cross section is higher than that of comparable springs with round cross section.

The working life is nevertheless a little lower, because of the unfavourable stress distribution in the cross section.

Order example: Helical spring with square cross section **SZ 8200**

$D_a = 19,5 \text{ mm}$, $l_0 = 45 \text{ mm}$

Add **19,5 x 45**

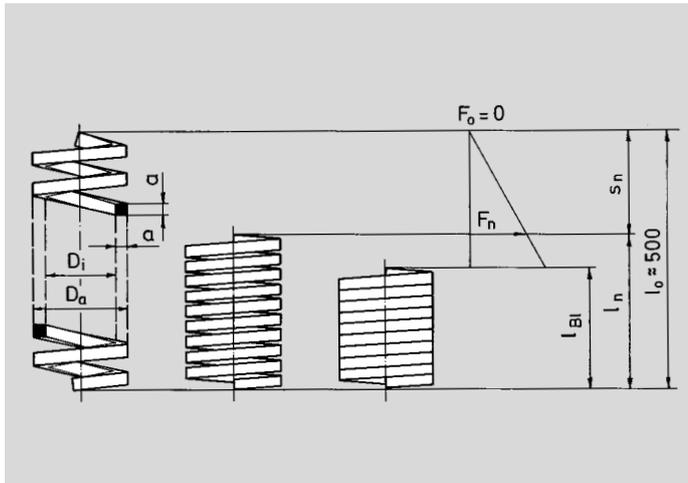

Order number **SZ 8200.19,5 x 45**

Disc springs

DIN 2093, column A and B

sizes in parenthese are not according to DIN.

Note:

F = spring tension (N)
a = travel stroke (mm)

Order example: Disc spring **SZ 8300**
D_a = 25 mm, D_i = 12,2 mm, t = 1,5 mm
Add **25 x 12,2 x 1,5**
Order number **SZ 8300.25 x 12,2 x 1,5**

Add size to order number

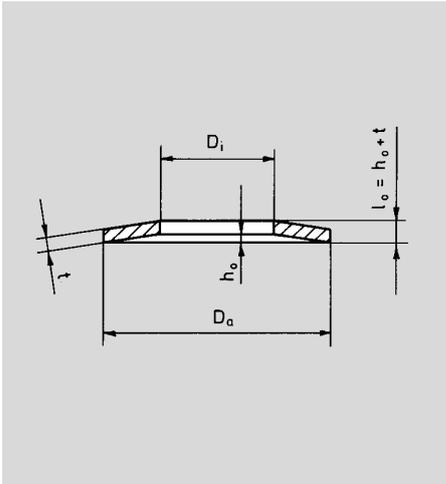

Order number **SZ 8300.** x x

*) Disc springs arranged according to forces see concerning page. Sizes in parentheses are not according to DIN.

Disc springs

arranged according to forces

Explication:

F = Spring tension (N) of a disc spring respectively a group with $s = 0,75 h_0$.
The named force at two or threefold layer arrangement is the theoretically calculated value. The real data differ because of occurring friction losses.

s = Travel stroke of one disc respectively of a group ($0,75 h_0$).

l_{01} = Total height of single disc ($h_0 + t$).

l_{02} = Total height of a single group with two-fold layer arrangement ($h_0 + 2 \cdot t$).

l_{03} = Total height of a disc group threefold layer arrangement ($h_0 + 3 \cdot t$).

Disc springs

arranged according to forces

Explication:

F = Spring tension (N) of a disc spring respectively a group with $s = 0,75 h_0$.
The named force at two or threefold layer arrangement is the theoretically calculated value. The real data differ because of occurring friction losses.

s = Travel stroke of one disc respectively of a group ($0,75 h_0$).

l_{01} = Total height of single disc ($h_0 + t$).

l_{02} = Total height of a single group with two-fold layer arrangement ($h_0 + 2 \cdot t$).

l_{03} = Total height of a disc group threefold layer arrangement ($h_0 + 3 \cdot t$).

Three-Piece Stripper Bolt Unit SZ 8580

Three-Piece Stripper Bolt Unit

The three-piece stripper bolt unit is used as a holding piece, spring unit, fitting bolt or a distance collar unit.

Design:

Distance collar: Material 9 S Mn 28K
Case-hardened 62 – 65 HRC
Outside diameter ground

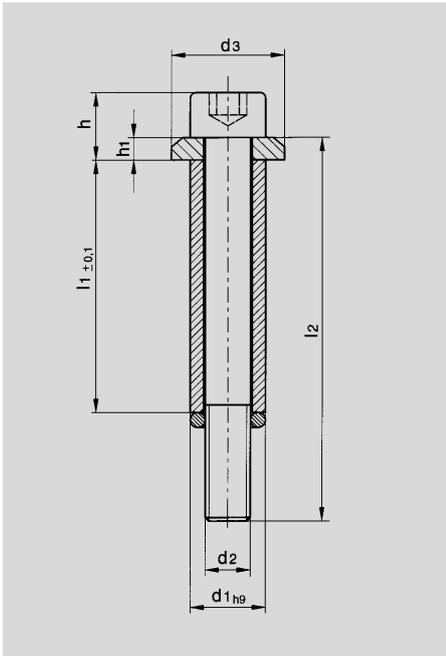

Tip:

The three-piece stripper bolt unit is mounted with an o-ring at delivery. Please remove it before installing.

Order example: Three-piece stripper bolt unit complete **SZ 8580**
 $d_1 = 12$ mm, $l_1 = 50$ mm
Add **12 x 050**

Examples of use

Spring Unit SZ 8526, SZ 8527

for Elastomer Springs

Elastomer spring unit complete

The elastomer spring units can be used for any compression distance / stroke. The spring travel including pre-load is max. 25% to 35% of L_0 of the elastomer spring in use.

The elastomer spring unit complete consists of:

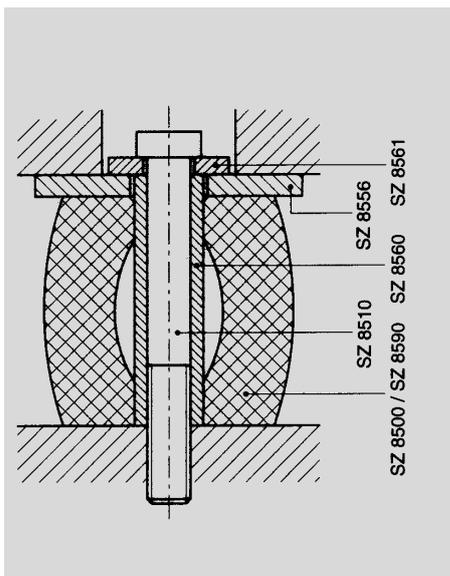

- Elastomer spring SZ 8500 or SZ 8590
- Spring washer SZ 8556
- Disc SZ 8561
- Distance collar SZ 8560
- Cheese head screw SZ 8510

Order example: Elastomer spring unit with rubber spring SZ 8500

Hollow plastic tubes

Material: Vulkollan
polyurethane-elastomer (PUR)
on Desmodur 15 base

Raw material for special length springs,
dampening washers, assembly parts and
prototypes.

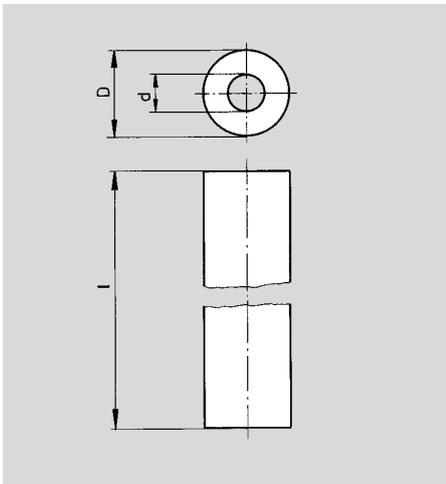

Available in strengths of
80 ± 5 Shore A and
90 ± 5 Shore A

Order example: Hollow plastic tube
strength 80, shore A, **SZ 5381**
D = 50 mm, l = 400 mm
Add **050 x 400**
Order number **SZ 5381.050 x 400**

Application tip

Resistant to: oil (lubricant oil), grease, alcohol,
benzene, ozone.

Partially resistant to: water lye, acids.
Please verify duration, temperature and/or
concentration before use.

SZ 5381

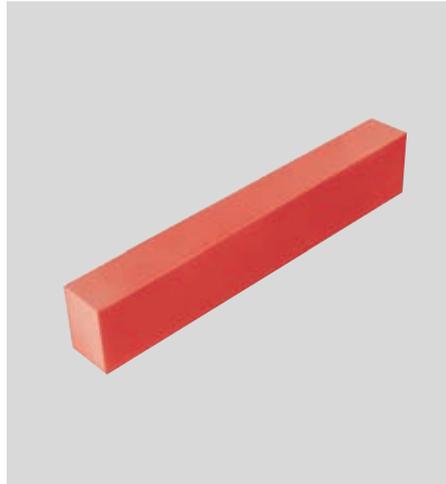

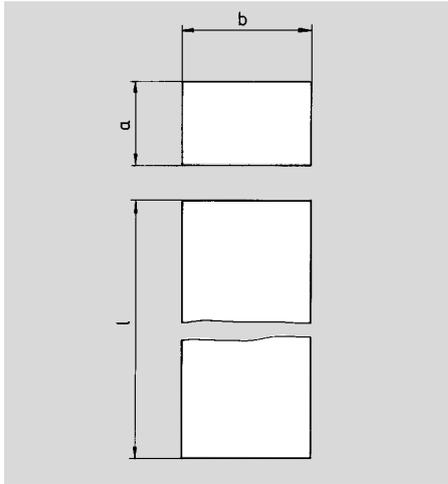

Permissible spring compression $s_{max} = 35\%$
spring sag 5 – 7 %
temperature range -20 °C to + 80 °C
temporarily -40 °C to +120 °C.

SZ 5391

Permissible spring compression $s_{max} = 30\%$
spring sag 6 – 8 %
temperature range -20 °C to + 80 °C
temporarily -40 °C to +120 °C.

Spring-mounted pressure devices mechanic

Application:

Pressure devices are mainly used in production of tool, equipment and machines as pressure pins, for holding parts down or ejecting parts, or for absorbing vibration.

Installation note:

Screwing the spring-mounted pressure devices in and out should only be done with the correct size special key SZ 8160. The coloured thread marking also serves to ensure threading.

Helical compression springs in four types of load

The system springs made of profiled valve-spring steel wire are available in four load types. Each of these four helical compression springs has got the same assembling dimensions, so that an increase respectively a reduction of compressive forces can ensue without any problems, also subsequently.

For immediate distinction the system springs are characterized by different colours and therefore can quickly be allocated to the respective type of load.

Ascending part numbers also mean ascending loads of the system springs, so it is only necessary to add the tube diameter (D_h) x of the unloaded spring length (L_0).

Order number	Types of load	Ident. colour
SZ8010. $D_h \times L_0$	light load	green
SZ8020. $D_h \times L_0$	medium load	blue
SZ8030. $D_h \times L_0$	heavy load	red
SZ8040. $D_h \times L_0$	extra heavy load	yellow

ISO 10243

Assembling dimensions – basic sizes

The STEINEL system springs are available in nine basic sizes with the following tube diameters (D_h) and rod diameters (D_d):

D_h/D_d	D_h/D_d	D_h/D_d
10/5	20/10	40/20
12,5/6,3	25/12,5	50/25
16/8	32/16	63/38

The assembling lengths of the unloaded springs (L_0) base on inch sizes according to 25 – 254 mm.

For all basic sizes there are 305 mm long springs available, too, which can be shortened as occasion demands.

Material

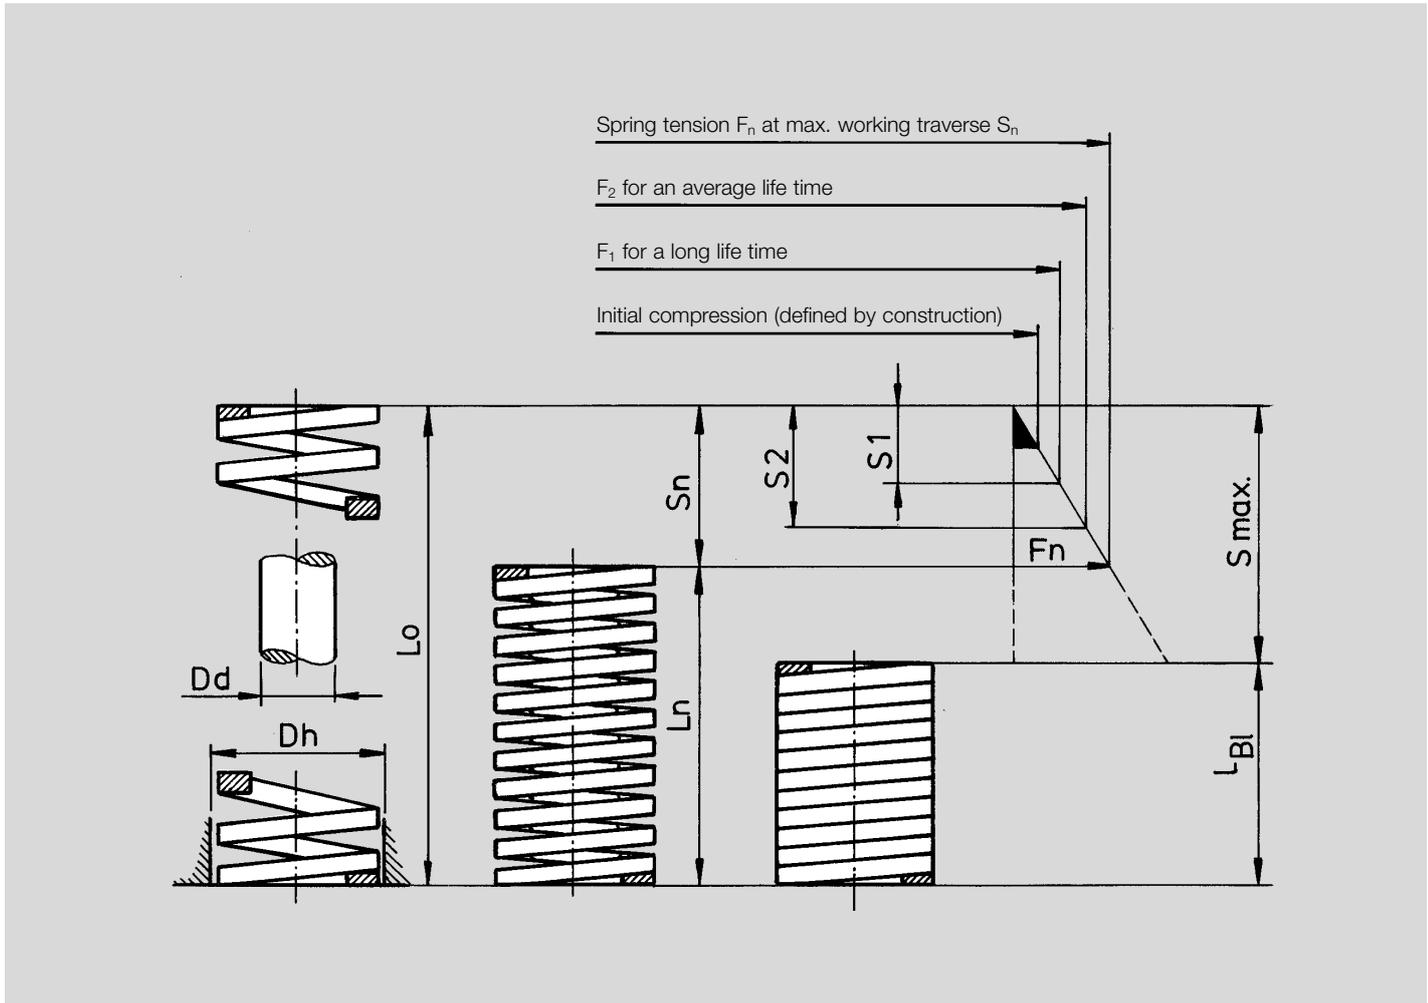

All springs are made of alloyed valve-spring steel wire (Cr-V/CR-Si). This wire is especially resistant against heat and vibration strains. Moreover this quality can also be used for higher temperature ranges up to 230 °C.

Manufacturing process and testing method

All springs are subject to special heat treatments, shot peened and initial-loaded. Thereby tensions are eliminated, to get a high fatigue limit.

The ends of the springs are closed and ground square with parallel faces.

The springs are subjected to strict quality checks, with vibration trials additional tests ensue concerning the working life.

Legend of the dimension symbols

- D_h = tube diameters (outward guiding) in mm
- D_d = rod diameter (internal guiding) in mm
- L_0 = length of the unloaded spring
- c = spring coefficient in N/mm
(spring tension causing spring strokes in mm)
- $s_1 - s_n$ = travel strokes in mm
caused to the spring tensions $F_1 - F_n$
- $F_1 - F_n$ = spring tensions in N
caused to the travel strokes $s_1 - s_n$
- L_n = minimal allowable length of the loaded spring ($L_0 - s_n$)
caused to the spring tension F_n
- S_{max} = maximal travel stroke in mm
- L_{BI} = block length of compacted spring ($L_0 - s_{max}$)

Tolerances for the length of the unloaded spring, L_0

L_0 mm $\pm 3\%$	L_0 mm $\pm 2,5\%$	L_0 mm $\pm 2\%$
25	76	127
32	89	139
38	102	152
44	115	178
51		203
64		254
		305

Constructional directives for selection

- priority the stroke
- priority the spring tension
- priority the working life

Note:

It is not allowed to exceed the travel stroke s_n (max. working traverse) and the resulting spring tension F_n , listed in the table.

Every spring should by principle be pre-loaded, because natural vibrations and push shock stresses of an unloaded spring reduce the working life.

Every spring has to be guided by an outward guiding (D_h) and/or an internal guiding (D_d). A rule of thumbs is: The crevasse depth of counterboring respectively the rod length should amount at minimum to 2 – 3 windings of the spring. The longer the spring, the longer the guiding.

Constructively it should always be aimed at a long working life of the springs. Therefore, the spring should preferable be chosen acc. to the travel stroke s_1 and the resulting spring tension F_1 .

Travel stroke symbols

- s_1 = long working life
- s_2 = average working life
- s_n = max. working traverse
- s_{max} = max. travel stroke

System springs

Quick review

Helical compression springs in four groups

Material: profiled valve-spring steel wire (Cr-V / Cr-Si)

The springs are initial-loaded, the ends are closed and ground square parallel.

Important characteristics data:

D_h = tube diameter in mm

L_0 = length of the unloaded spring in mm

c = spring coefficient in N/mm (spring tension causing spring strokes in mm)

System springs SZ 8005

for extra light load, colour purple

STEINEL[®]
NORMALIEN

Helical compression springs for extra light load

Material: Profiled valve-spring steel wire (Cr-V / Cr-Si)

Tolerances similar to DIN 2095

The springs are initial-loaded, the ends are closed and ground square parallel.

Order example: System spring for extra light load **SZ 8005**

$D_h = 25 \text{ mm}$, $L_0 = 76 \text{ mm}$

Add **25 x 076**

Order number **SZ 8005.25 x 076**

System springs SZ 8010

for light load, colour green

STEINEL[®]
NORMALIEN

Helical compression springs for light load

Material: Profiled valve-spring steel wire (Cr-V / Cr-Si)

Tolerances similar to DIN 2095

The springs are initial-loaded, the ends are closed and ground square parallel.

Order example: System spring for light load **SZ 8010**

$D_h = 25 \text{ mm}$, $L_0 = 76 \text{ mm}$

Add **25 x 076**

Order number **SZ 8010.25 x 076**

ISO 10243

Add size to order number

System springs SZ 8030

for heavy load, colour red

STEINEL[®]
NORMALIEN

Helical compression springs for heavy load

Material: Profiled valve-spring steel wire (Cr-V / Cr-Si)

Tolerances similar to DIN 2095

The springs are initial-loaded, the ends are closed and ground square parallel.

Order example: System spring for heavy load **SZ 8030**

$D_h = 25 \text{ mm}$, $L_0 = 76 \text{ mm}$

Add **25 x 076**

Order number **SZ 8030.25 x 076**

ISO 10243

Add size to order number

System springs SZ 8040

for extra heavy load, colour yellow

STEINEL[®]
NORMALIEN

Helical compression springs for extra heavy load

Material: profiled valve-spring steel wire (Cr-V / Cr-Si)

Tolerances similar to DIN 2095

The springs are initial-loaded, the ends are closed and ground square parallel.

Order example: System spring for extra heavy load **SZ 8040**

$D_h = 25 \text{ mm}$, $L_0 = 76 \text{ mm}$

Add **25 x 076**

Order number **SZ 8040.25 x 076**

ISO 10243

Add size to order number

Order number **SZ 8040.** x

System springs SZ 8045

for extra heavy loads

STEINEL®
NORMALIEN

Screw pressure springs for extra heavy loads

Material: Profiled valve-spring steel wire (Cr-V / Cr-Si)

Tolerances similar to DIN 2095

The springs are initial-loaded, the ends are closed and ground square parallel.

Order example: System spring for extra heavy load **SZ 8045**

$D_h = 25$ mm, $L_0 = 89$ mm

Add **25 x 089**

Order number **SZ 8045.25 x 089**

Add size to order number

System spring units SZ 8565

STEINEL®
NORMALIEN

System spring unit SZ 8565.00 complete, however without spring:

- 1 cheese-head screw SZ 8510
- 1 distance collar SZ 8560
- 1 thread disc SZ 8566
- 1 mating disc SZ 8567
- 1 tightening disc SZ 8568
- 1 regrinding disc SZ 8569

System spring unit complete with spring:

- SZ 8010 **SZ 8565.10**
- SZ 8020 **SZ 8565.20**
- SZ 8030 **SZ 8565.30**
- SZ 8040 **SZ 8565.40**

Helical springs

Helical springs with round cross section

Material: Patented drawn spring wire grade C according to DIN 17223

Efficiency rating 2 according to DIN 2095. The springs are initial loaded, 1 winding closed at both ends and ground square.

Indication: For long working life at an oscillatory loading s_{max} = about 0,7 s_n .

Springs with round cross section should be used preferably, because they have the most positive attributes.

Order example: Helical spiral springs with round cross section **SZ 8100**
 $D_a = 46$ mm, $l_0 = 67$ mm
 Add **46 x 67**
 Order number **SZ 8100.46 x 67**

*) Helical spiral springs arranged according to forces see concerning page

Helical springs

Helical springs with round cross section, 500 mm long

Material: Patented drawn spring wire grade C according to DIN 17223

Efficiency rating 2 according to DIN 2095. The springs are initial-loaded.

Indication: For long working life at an oscillatory loading $s_{max} = ca. 0,7 s_n$.

Helical springs 500 mm long are suited for production of any spring lengths. After the cutoff of the desired length, close ends of the springs and grind rectangular to the spring axis. Avoid excessive heating during closing!

Order example: Helical springs with round cross section, 500 mm long **SZ 8101**

$D_a = 18$ mm, $d = 4$ mm

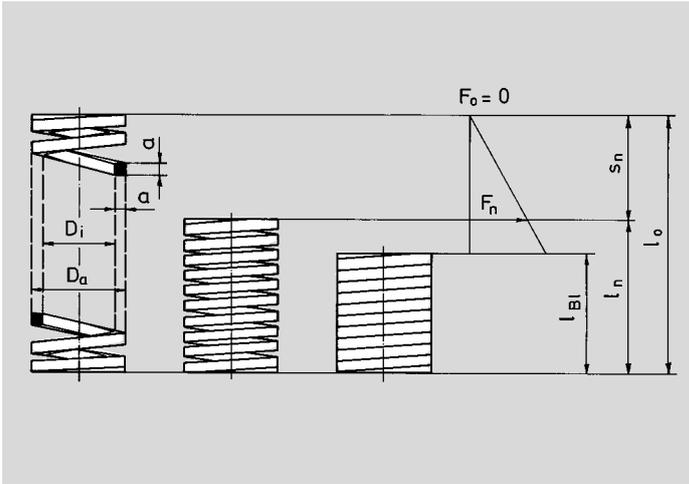

Add **18 x 4**

Order number **SZ 8101.18 x 4**

Add size to order number

Helical springs with square cross section

Material: Patented drawn spring wire grade C according to DIN 17223.

Tolerances similar to DIN 2095. The springs are initial-loaded, 1 each winding closed at both ends and ground square.

Indication: For long working life at an oscillatory loading $s_{max} = ca. 0,7 s_n$.

The spring tension of springs with square cross section is higher than that of comparable springs with round cross section.

The working life is nevertheless a little lower, because of the unfavourable stress distribution in the cross section.

Order example: Helical spring with square cross section **SZ 8200**

$D_a = 19,5 \text{ mm}$, $l_0 = 45 \text{ mm}$

Add **19,5 x 45**

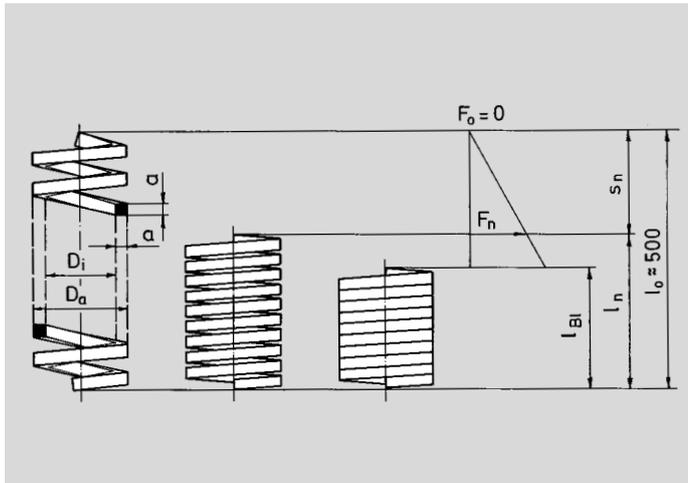

Order number **SZ 8200.19,5 x 45**

*) Helical springs arranged according to forces see concerning page

Helical springs with square cross section, 500 mm long

Material: Patented drawn spring wire grade C according to DIN 17223.

Tolerances similar to DIN 2095.
The springs are initial-loaded.

Indication: For long working life at an oscillatory loading $s_{max} = ca. 0,7 s_n$.

The spring tension of springs with square cross section is higher than that of comparable springs with round cross section.
The working life is nevertheless a little lower, because of the unfavourable stress distribution in the cross section.

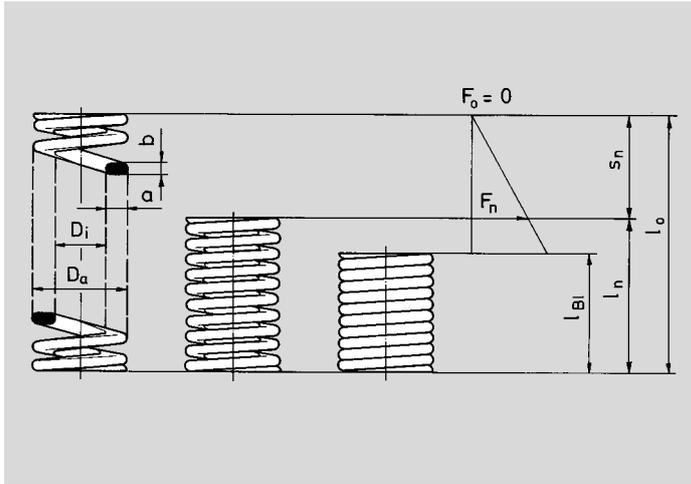

Helical springs 500 mm long are suited to be produced in any spring lengths. After the cutoff of the desired length, lay on ends of the springs and grind rectangular to the spring axis.
Avoid excessive heating during closing!

Order example: Helical springs with square cross section, 500 mm long **SZ 8201**
 $D_a = 19$ mm, $a = 4$ mm
Add **19 x 4**

Helical springs with oval cross section

Material: Patented drawn spring wire grade C according to DIN 17223.

Tolerances similar to DIN 2095. The springs are initial-loaded, 1 each winding closed at both ends and ground square.
Special treatment: blasted with steel balls.

Indication: For long working life at an oscillatory loading $s_{max} = ca. 0,7 s_n$.

The spring tension of springs with oval cross section is higher than that of comparable springs with round section.
The working life is nevertheless a little lower because of the unfavourable stress distribution in the cross section.

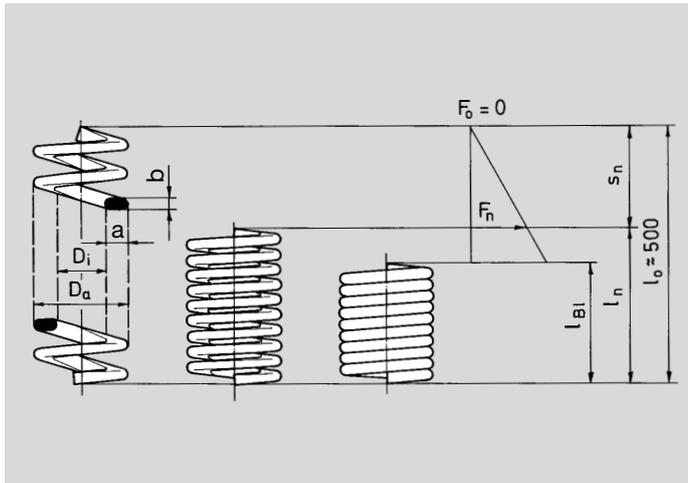

Order example: Helical spring with oval cross section **SZ 8400**
 $D_a = 32$ mm, $l_0 = 69$ mm

*) Disc springs arranged according to forces see concerning page. Sizes in parentheses are not according to DIN.

Disc springs

arranged according to forces

Explication:

F = Spring tension (N) of a disc spring respectively a group with $s = 0,75 h_0$.
The named force at two or threefold layer arrangement is the theoretically calculated value. The real data differ because of occurring friction losses.

s = Travel stroke of one disc respectively of a group ($0,75 h_0$).

l_{01} = Total height of single disc ($h_0 + t$).

l_{02} = Total height of a single group with two-fold layer arrangement ($h_0 + 2 \cdot t$).

l_{03} = Total height of a disc group threefold layer arrangement ($h_0 + 3 \cdot t$).

Three-Piece Stripper Bolt Unit SZ 8580

Three-Piece Stripper Bolt Unit

The three-piece stripper bolt unit is used as a holding piece, spring unit, fitting bolt or a distance collar unit.

Design:

Distance collar: Material 9 S Mn 28K
Case-hardened 62 – 65 HRC
Outside diameter ground

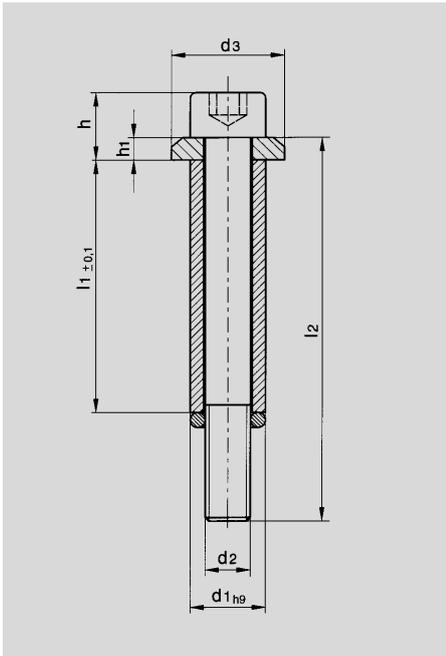

Tip:

The three-piece stripper bolt unit is mounted with an o-ring at delivery. Please remove it before installing.

Order example: Three-piece stripper bolt unit complete **SZ 8580**
 $d_1 = 12$ mm, $l_1 = 50$ mm
Add **12 x 050**
Order number **SZ 8580.12 x 050**

Examples of use

Spring Unit SZ 8526, SZ 8527

for Elastomer Springs

Elastomer spring unit complete

The elastomer spring units can be used for any compression distance / stroke. The spring travel including pre-load is max. 25% to 35% of L_0 of the elastomer spring in use.

The elastomer spring unit complete consists of:

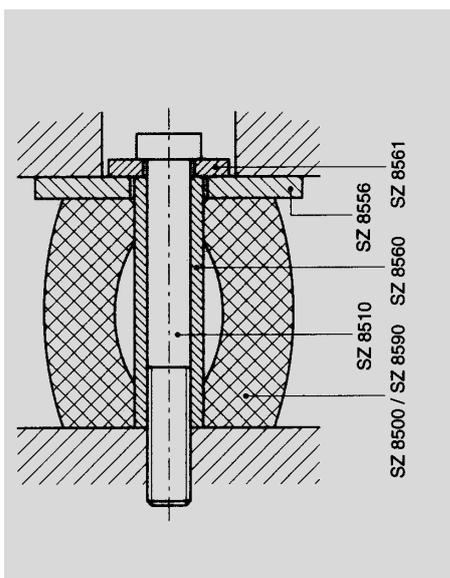

- Elastomer spring SZ 8500 or SZ 8590
- Spring washer SZ 8556
- Disc SZ 8561
- Distance collar SZ 8560
- Cheese head screw SZ 8510

Order example: Elastomer spring unit with rubber spring SZ 8500

$d_1 = 50\text{ mm}$, $l_1 = 63\text{ mm}$

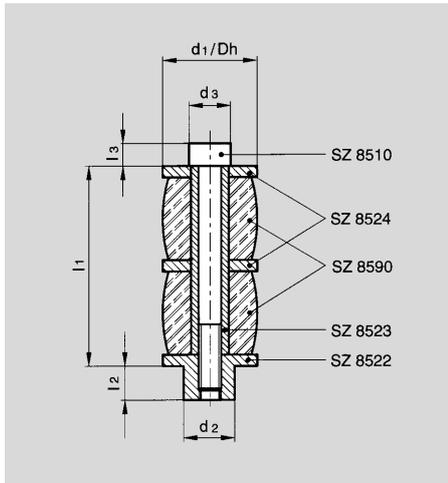

Add: **050 x 063**

Order number **SZ 8526.050 x 063**

Hollow plastic tubes

Material: Vulkollan
polyurethane-elastomer (PUR)
on Desmodur 15 base

Raw material for special length springs,
dampening washers, assembly parts and
prototypes.

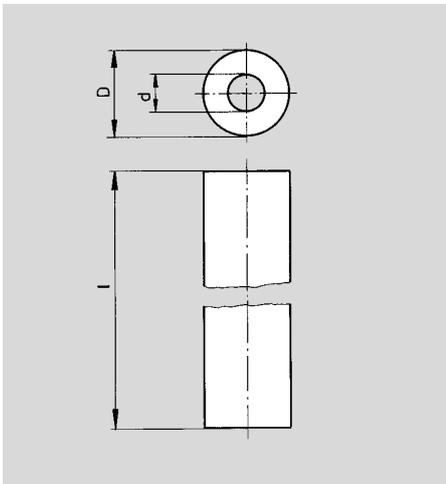

Available in strengths of
80 ± 5 Shore A and
90 ± 5 Shore A

Order example: Hollow plastic tube
strength 80, shore A, **SZ 5381**
D = 50 mm, l = 400 mm
Add **050 x 400**
Order number **SZ 5381.050 x 400**

Application tip

Resistant to: oil (lubricant oil), grease, alcohol,
benzene, ozone.

Partially resistant to: water lye, acids.
Please verify duration, temperature and/or
concentration before use.

SZ 5381

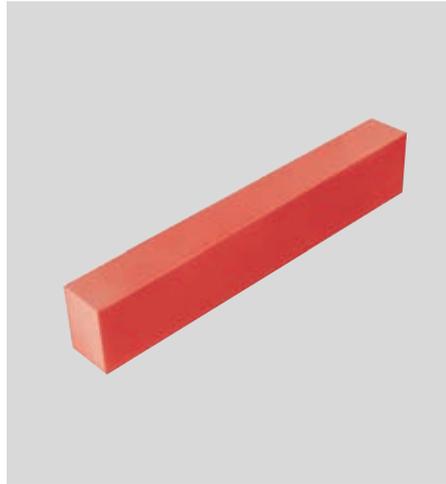

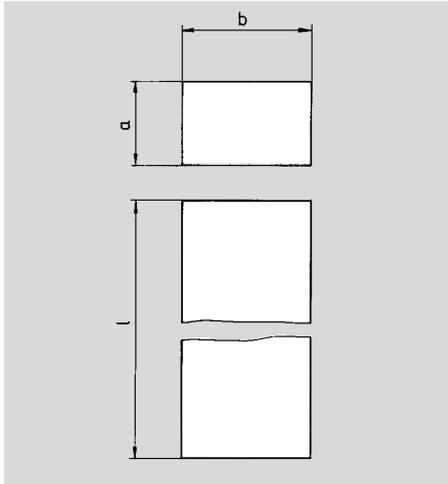

Permissible spring compression $s_{max} = 35\%$
spring sag 5 – 7 %
temperature range -20 °C to + 80 °C
temporarily -40 °C to +120 °C.

SZ 5391

Permissible spring compression $s_{max} = 30\%$
spring sag 6 – 8 %
temperature range -20 °C to + 80 °C
temporarily -40 °C to +120 °C.

Spring-mounted pressure devices mechanic

Application:

Pressure devices are mainly used in production of tool, equipment and machines as pressure pins, for holding parts down or ejecting parts, or for absorbing vibration.

Installation note:

Screwing the spring-mounted pressure devices in and out should only be done with the correct size special key SZ 8160. The coloured thread marking also serves to ensure threading.

Clamping sockets with flange **SZ 4080**

d₁ = 20, d₃ = 68 mm

Add **20 x 068**

Order number **SZ 4080.20 x 068**

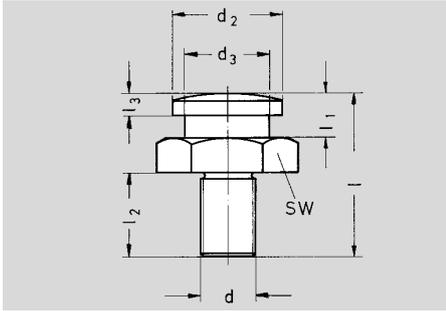

Clamping sockets DIN 9859/ISO 10242

Material: 1.0503 (C 45)

Clamping sockets with flange are screwed onto the die set upper plate and result more favourable guide rates with a large stroke, due to the use of longer guide pillars.

Order number **SZ 4080.** x

123	48	32	105	9	19	23	9,5	9	123 x 48

Receiving-chucks for wobblers

Material: 1.0503 (C 45)

The receiving-chuck is used together with a wobbler for a loose assembly of the die set upper plate with the press plunger. The plug diameters are in accordance with the standardized press plunger bore-holes. They are suitable to all Steinel wobblers.

Order number **SZ 4160.** x

Order example:

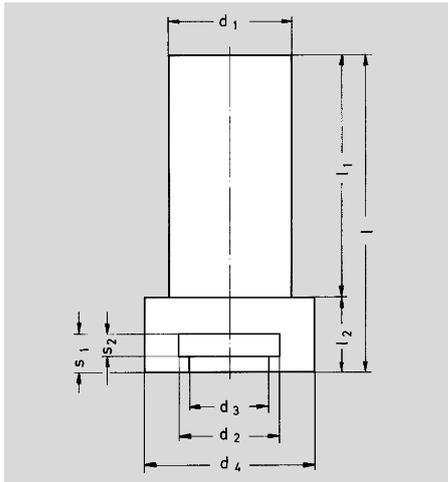

Receiving-chucks for wobblers **SZ 4160**

$d_1 = 32$, $d_2 = 49$ mm

Add **32 x 49**

Order number **SZ 4160.32 x 49**

Eye ring, rotatable

With key, hexagon shape

Material: 1.6541 forged, high-tensile quenched and tempered. 100% electromagnetic inspection for cracks per DIN 5691, EN 1677

Characteristic: Distinct load capacity specification for the unfavourable load F area, which is not allowed with DIN 580.

Note: The eye ring is rotatable only when tightly screwed in.

Order example: Eye ring, rotatable

Load Hook SZ 4391

Rotating load hook

Special features:

- Running in two sets of ball bearings for jolt-free tilting, rotating and turning.
- Suitable for all separate lifting accessories – whether hooks, loops or slings.
- No protruding hook tip.
- Forged, hardened & tempered safety latch catching inhook tip – this safeguards against lateral bending.
- Triple coiled, stainless steel double torsion spring.
- Thickened hook tip against improper use.

Order example: Load hook **SZ 4391**

Carrying bolt SZ 4366

with safety ring

Carrying bolt with safety ring

VDI 3366

Material: Steel 1.0503 bzw. 1.7227

Areas of application: Press tools with cast carrying inserts

Note:

The bolts must always be inserted from the outside to the middle of the tool, some exceptions possible. Note the safety area on both outsides of the casting and the assembly area on one side. Do not leave any carrying bolts in the upper part of the tools during production. Remove them beforehand, in order to prevent any accidents.

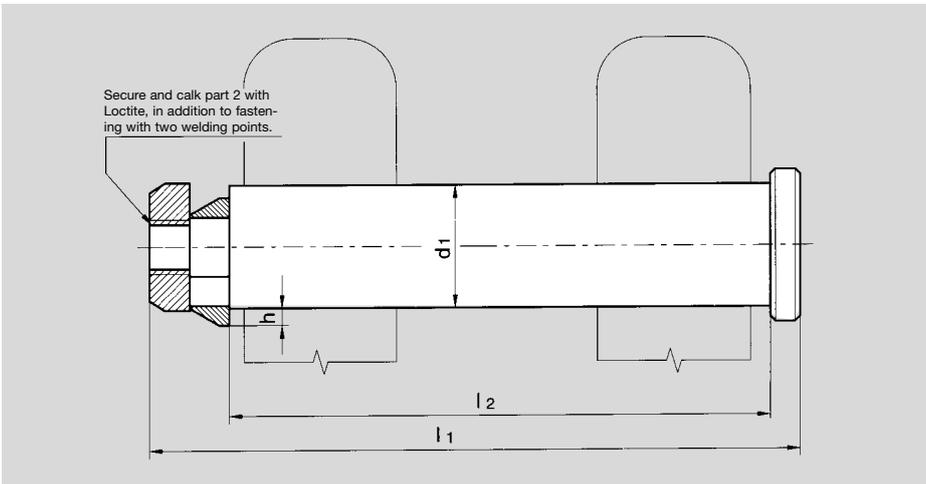

The maximum load capacity d_1 is measured, so that two bolts are used to carry the tool.

Order example: Carrying bolt with safety ring **SZ 4366**

$d_1 = 40$ mm

Add **4**

Holding magnets

round and flat

Holding magnets round

Screened system
Application temperature up to 450° C

Mounting hints: Round holding magnets SZ 9335 are pressed, shrunk or glued into the mounting bore-holes. How to do the mounting is shown in the illustration.

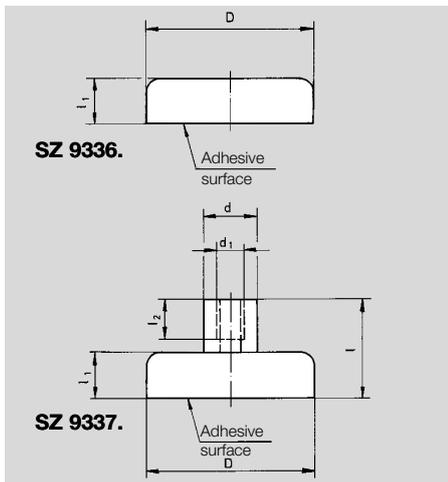

Order example: Holding magnets round
SZ 9335
d = 6 mm
Add **06**
Order number **SZ 9335.06**

*) The holding magnets can be shortened by the measure l_2 without any reduction of the adhesion.

**) The adhesive surface should not be decreased by more than 2 mm, otherwise the adhesion would be strongly reduced.

d_{h6}	$l_1 \pm 0,2$	l_2^*	Minimum adhesion (N)	
6	10	2	1	06
8	12	3	2,5	08
10	16	6	5	10
13	18	7	8	13
16	20	5	15	16
20	25	6	35	20
25	30	5	80	25
32	35	3	150	32

Order number **SZ 9335.** Add size to order number

Holding magnets flat

Surface galvanized, screened system,
application temperature up to 100° C

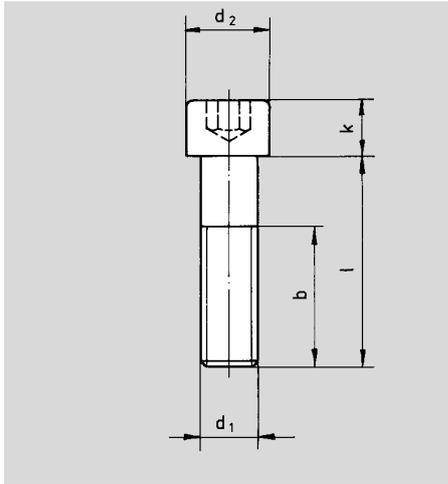

Mounting hints: Flat holding magnets are pressed or glued into the mounting bore-holes, SZ 9337 screwed on.

Order example: Holding magnets flat **SZ 9336**
D = 13 mm
Add **13**
Order number **SZ 9336.13**

D	d	d ₁	l	l ₁	l ₂	Minimum adhesion (N)

Precision cylindrical pins

Precision cylindrical pins with inside thread

Structural dimensions according to DIN EN ISO 8735

Material: High grade chrome – alloyed casehardening steel, casehardened, hardness HRC 60 ± 2

Precision workmanship ground and lapped, ISO m 5, with air escape surface

Use with blind-end bores, if the drive-out of the pin from the rear side is not possible.

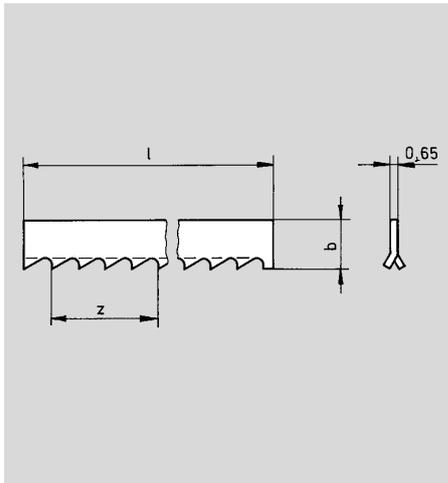

Order example: Precision cylindrical pin with inside thread **SZ 7905**
d₁ = 8 mm, l = 32 mm
Add **08 x 032**
Order number **SZ 7905.08 x 032**

High-performance oil

Characteristics:

The high-performance oil with molybdenum-disulphide (MoS₂)-additive is especially well suited for highly stressed narrow running fits due to its viscosity and composition. The viscosity additive acts anti-attributioning creating a bearing armouring having excellent emergency running properties.

Fields of application:

Lubrication of die sets, guides, etc.

in a canister 5 l

Order number **SZ 9850**

400 ml in a spray can

Order number **SZ 9851**

High-performance oil (Slidingway oil No. 1)

Characteristics:

Modern demulsifying sliding way oil with excellent anti-stick and slip properties to lubricate metal and plastic sliding guides, sliding ways with solid lubrication as well as ball and roller guides. It is also suitable as a universal oil to lubricate machine tools.

Fields of application:

Lubrication of die sets, sliding guides etc.

in a canister 5 l

Order number **SZ 9853**

High-performance grease

Characteristics:

- Performance optimized long time lubrication grease
- Highest anti-corrosion protection
- Best water resistance
- -30° degrees Celsius to +120° degrees Celsius

in a 400 g cartridge

Order number **SZ 9006**

in a bucket 15,0 kg

Order number **SZ 9006.15**

Suitable grease gun: SZ 9810

Roller bearing grease

Special lubricant for high demands

Characteristics:

- Superior wearing protection
- Good temperature stability up to 140 °C (284 °F)
- Excellent water and medium stability
- Good corrosion prevention
- Very good age stability

Fields of application:

Lubrication of ball and roller guides

in a 400 g cartridge

Order number **SZ 9005**

Suitable grease gun: SZ 9810

Fat solvent, anti-corrosion oil, slushing oil, tracing paint

Fat solvent

300 ml in the spray can
Order number **SZ 9010**

The solvent from the spray can easily softens oil and fat coats and removes them. Parts which are to be cast en bloc, glued or sprayed with tracing paint should be cleaned with fat solvent from the spray can. The adhesive force of the compound is thereby essentially increased.

Combustible!
Filled with safety fuel gas

Anti-corrosion oil

300 ml in the spray can
Order number **SZ 9012**

For untightening struck or corroded screws, nuts, interference fits etc. Effective lubrication of chains, locks, hinges etc. Little surface tension, therefore quick and deep penetration into even utmost narrow joints and fits. High lubricating effect, sustained corrosion protection.

Filled with safety fuel gas.

Slushing oil

300 ml in the spray can
Order number **SZ 9013**

Active agent for corrosion protection with sustaining its effect for several months by releasing gases penetrate into hollow bodies, bores, taps etc. where there is difficult access protecting iron and steel parts having direct contact.

Filled with safety fuel gas.

Tracing paint

300 ml in the spray can
Order number **SZ 9020**

It couldn't be done any faster! Just spray on – already tracing. Paint will dry without peeling off. Even and permanent paint film. Also for marking workpieces, work cycles and packages very well suited.

Filled with safety fuel gas.

Multifunctions spray WD-40

400 ml in the spray can
Order number **SZ 9014**

The five basic functions

- Displaces Moisture
- Protects
- Penetrates
- Lubricates
- Cleans

Anaerobic bonding agents for plastics

Anaerobic bonding agents for plastics are distributed onto the mounting parts in a liquid state. They stay liquid as long as oxygen has got access. Not before the parts are mounted but with the occlusion of oxygen and metal contact the chemical transformation is started from the liquid state into a tough substance formed by linear molecule chains.

Due to its effective capillarity this plastic material fills out even smallest interspaces. It cramps fast in the surface roughness of the parts that are to be linked together. The jointing gap is so filled completely out. Due to this 100% surface contact an interlocking compound is formed which is shock and vibration-proof.

Constructional outlay of a compound

A jointing and bonding compound should always be laid out in a way that only pulling, pressing and shearing forces occur – not however peel-off forces.

A high L/D ratio (Length/Diameter) grants a good tensional distribution in the bonding gap.

Gap filling

Bull noses and basils sized sufficiently big enable an even dissipation of the product upon mounting jointing parts. In case of press-fits and of bigger sizes always moisten both surfaces thinly and evenly with the concerning LOCTITE product.

Moisten the bore of blind holes in such a way to prevent the compressed air from driving the liquid bonding agent away upon mounting.

Joining different materials

When joining different materials (for example steel bolts in an alu-housing) with operating temperatures over 50 °C the various coefficients of thermal expansion must be taken into consideration. Aluminium expands for instance twice as much as steel does.

Compatibility with other materials

The materials used most (metals, sintered materials, ceramics and glass) are chemically not changed by the liquid bonding agents for plastics.

The hardened layer stays chemically neutral.

The following plastic materials can be affected and show reactions after a longer period of time: vinyl, ABS-products, polysulphone, PVC, polycarbonate, polystyrene, SAN-products and lacquered surfaces.

Solubility

The liquid anaerobic LOCTITE products are soluble in trichlorethylene and in many other chlorinated hydrocarbons.

Chemical constancy

The fully hardened LOCTITE products show a very good stability with regard to oil, benzene, organic solvents and coolants.

The greater the sturdiness is of a special type of bonding agent the greater is the chemical constancy.

Storing time

With room temperature the LOCTITE products are storable for at least 1 year. The content of air in the bottles is necessary in order to prevent a hardening before use. Screws, metal parts or brushes must not be dipped into the bottle. Soiled LOCTITE must not be poured back into the bottle. The activator must not be mixed with LOCTITE products to prevent any hardening.

Aktivator 7649

A hardening accelerator for anaerobic products loctite 542, 603 and 270. Reduces time required for hardening. Simple use: spray on, and let dry – and then apply the loctite product.

Colour: light yellow
contains: acetone
flammable
storage duration: 1 year

500 ml pump bottle

Order number **SZ 9740**

Gluing of flat surfaces LOCTITE 496

A glue for the gluing of difficult components such as steel plates, bearings, and ceramics respectively, and among each other.

glue gap max. 0.1 mm
preferably 0.05 mm

Hardening time

Hard to the touch with Activator 7649 20–40 sek
Final hardness ≈12 hrs

Colour: colourless
100 ml in plastic bottle
shelf life: 1 year

Order number **SZ 9741**

Axle-Hub connection bearing glue LOCTITE 603

For tension-free, enduring fastening of parts with radial and axial pressure, such as bearings, bushings, axles, pins, rotors, gear wheels, rings, tires and sinterbearings. The extrusion force of press fits increases by approximately 100% and more. Fitting rust and leakage are avoided. Thin liquid, only very difficult to break fastening.

glue gap max. 0.15 mm
preferably 0.05 mm

Hardening time

hard to the touch 10–30 min.
Functional hardness 30–60 min.
Final hardness ≈ 6 hrs

Colour: green
50 ml in plastic bottle
shelf life: 1 year

Order number **SZ 9742**

Fastening of screws very difficult to break fastening, LOCTITE 270

A highly viscous glue for the connection of bearings, bushings, spacer bolts, for the securing and simultaneous sealing of stud bolts and screws. Highly resistant to vibrations and pressure. Decidedly higher fitting area between two parts.

Reliable sealing of hydraulic and pneumatic cables as well as other highly used pipes. High resistance to pressure and lye solutions; only difficult to break fastening.

glue gap max. 0.15 mm
preferably 0.05 mm
thread up to M 20

Hardening time

Hard to the touch 10–30 min.
Functional hardness 1–3 hrs
Final hardness 3–6 hrs

Colour: green
50 ml in plastic bottle

Order number **SZ 9743**

Joint fastening medium tight LOCTITE 542

Medium tight connection for hydraulic and pneumatic cables for the securing of parts, that will need to be able to be removed/loosened with normal tools. LOCTITE 542 seals screw threads against the standard hydraulic fluids. It is nixothopic, and does not run. To be used for hydraulic and pneumatic fittings, so well as pipe coils up to R 1/2".

Easily broken connection
max. glue gap 0.12 mm

Hardening time

Hard to the touch 10–30 min.
Final hardness ≈ 3 hrs

Colour: brown
50 ml in plastic bottle

Order number **SZ 9717**

Fastglue gel LOCTITE 454

A drip and run-free glue for gluing metal, plastics, wood, paper, rubber, leather, etc. It can be used to glue substances with rough surfaces.

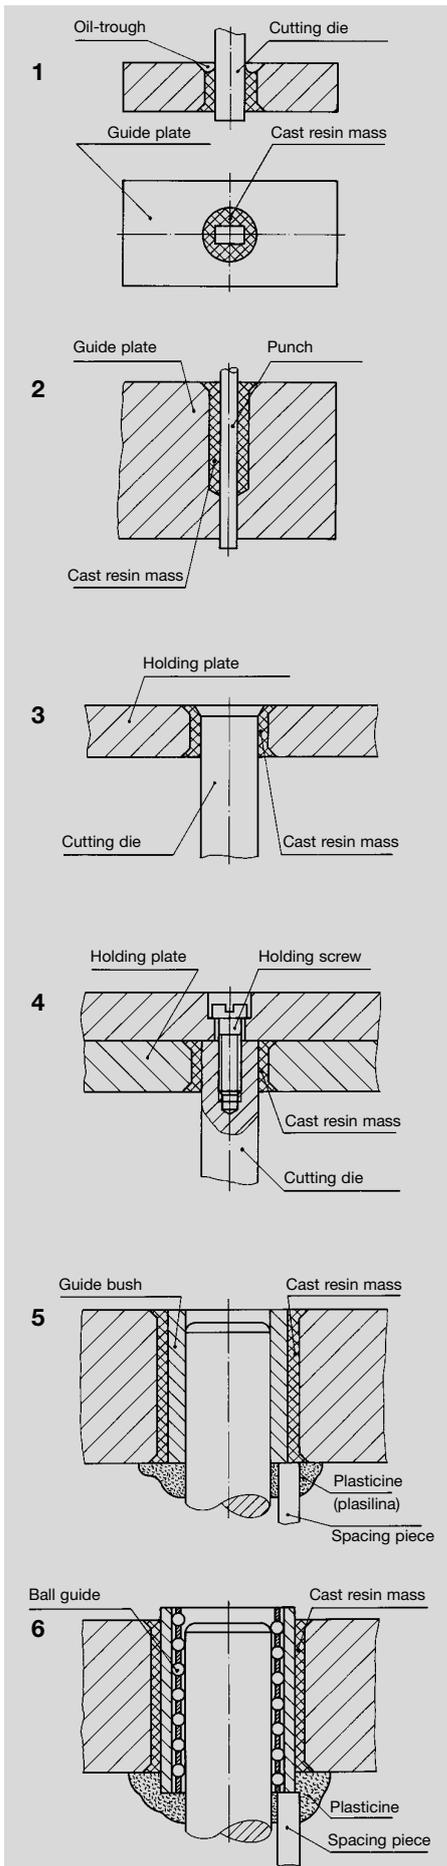

glue gap 0.20 mm
preferably 0.05 mm

Hardening time

Hard to the touch 5–20 sek
Final hardness 12 hrs

Colour: colourless
20 g in plastic tube

Order number **SZ 9744**

Introduction

The usage of cast resin mass in the blanking tool engineering has essentially facilitated the creation of breaking-throughs for profiled dies but also the fixing of cutting dies and guides. By the use of casting resin in a great reduction of the manufacture and repair costs, a valuable saving of skilled workers' hours, in certain cases even quality and tool life improvements have been obtained. The casting of resin to certain parts of cutting and punching dies is applied with good success to:

- dies with slide play in guide plates
- interchangeable dies with holding plates
- fixed dies in holding plates
- fixed guide bushes in die sets
- dies in ejectors
- die-plate inserts

The epoxy casting resin system ARALDIT CW 2418 with the activator Hy 5162 (has reactions) developed for this special usage has an enormous adhesion, excellent sliding properties, a high resistance to pressure, is relatively fluid and admits small casting gaps. It can be cast and hardened in room temperature. Dwindling is very little and negligible.

The resin enriched in factory with filler can be cast in layers of 1 – 10 mm. It is very reactive and hardens very well even in thin layers.

Preparation of tools parts

The epoxy casting resin system ARALDIT CW 2418 adheres very well on all materials, especially well on metals. Therefore all tool parts which are to stay moveable after the casting as f. e. dies must be pretreated with the separating agent QZ 5111 (SZ 9704). By some polishing of the pretreated surfaces with a woolen cloth the separating effect and surface quality of the cast resin moulding material can be improved. Multiple applications of the separating agent QZ 5111 (SZ 9704) result in a greater sliding play.

Interchangeable tool parts and dies must absolutely be aligned plane-parallel and must possess the surface roughness "fine".

The breaking throughs in the guide and die plates just like resin cast fixed dies, guide bushes and die-plate inserts must be free from grease and should be roughened. With grooves, bores or pins the connection of the cast resin material and the metal can still be improved.

Examples for the casting

1st Cutting dies with sliding play in the guide-plates.

The breaking-through in the guide-plate is delineated from the ready cutting plate and is bored about 1 – 3 mm bigger or sawed out. The sawed out resp. drilled fraction surfaces must be degreased. The contact surfaces of the two plates must be sprayed with the separating agent QZ 5111 (SZ 9704) or be provided with a wax paper interlining to prevent a mutual gluing together; then the contact surfaces are clamped to each other. The die coated with the separating agent is to put into the fraction, centered in the cutting plate and held by magnetic angles in vertical position. Then the casting is done and after the past resin mass has become hard the final cutting play between die and the cutting plate fraction is arranged.

In case of profiled dies the mould rupture in the guide plate can be substituted by a bore by casting Araldit CW 2418 into the rupture (1).

In case of thin cutting dies which must be rather long for reasons of stability the guide plate must be cast out (2).

2nd Cutting dies having a firm seat holding plates.

The casting is done by the same principle as with the guide plates. The position of the cutting die is determined by the cutting, the guiding, stripper or ejector plate in conformity to the tool type. As the die must sit firmly in the holding plate the punch head must be roughened and degreased. Picture (3) shows a cast cutting die with conical head.

With mould dies it is useful to provide the holding portion with grooves and to lay out the fraction conically in the holding plate. In certain cases it is necessary to lessen the stripping forces by additional holding screws (4). The cast resin mass only serves then for fixing the position of the die.

3rd Interchangeable cutting dies in holding plates.

If cast-in cutting dies for upkeep or repair should be interchangeable in the holding plate it must be noted that the die head must be applied with a separating agent and that the breaking-through is roughened and degreased.

4th Guide bushes with firm seats in die-sets.

Cast-in-die-sets having their firm seat in the top of the die-set have the advantage that there happens to be no narrowing due to the press-fit, and that the guidance diameter must not be honed a second time.

Furthermore costly fineboring, lapping works and taking the finishing cut need not be done, and the quality is thereby not lessened.

The position bore for the guide bush in the top part should be 3 to 6 mm bigger than the outside diameter of the guide bush. Bore and outside surface of the bush must be roughened and degreased.

The top part is moved over the guide bushes seated on the columns of the lower part, is aligned on a parallel base and charged. The cast gap must be sealed from bottom with plasticine (Plastilina), the guide bush must be supported by additional spacers (5). A cast out ball guide bush is depicted in (6).

Casting resin

Steel-filled black free-flowing epoxy cast resin system for coat thickness up to 10 mm adapted to the needs of the tool manufacture.

Fields of application

Cast-in of dies and cast-out of guides with blanking tools, foundries and contour milling models, general mould making, tools for sheet metal conversion.

Processing methods

Full mould casting
Front casting (conditionally suited only)

Characteristics

Black, fluid casting resin
Hardening in room temperature
Little sedimentation
Excellent pouring capability
Layers in thicknesses up to approx. 10 mm can be cast in one work cycle
Hard surfaces relatively resistant to abrasion with good sliding properties
Cutting properties good

Product description Araldite CW 2418

Modified epoxy resin containing filling materials
Supplied type: black thixotrope paste
Viscosity at 25 °C: 130.000 – 180.000 mPa.s
Density: 2,7 g/cm³
Flash point (Pensky-Martens): 200 °C
Storability at 18 – 25 °C: 1 year

Activator Hy 5162 (reactive)

Formulated polyamino-activator for layers in thicknesses up to 10 mm at max., especially designed for cutting die guides.

Supplied type: clear, light yellow liquid
Viscosity at 25 °C: 30–70 mPa.s
Density : 1.0 g/cm²
Flash point (Pensky-Martens): 108 °C
Storability at 18 – 25 °C: 1 year

Proportion of mixture

100 parts by weight of resin Araldite CW 2418
15 parts by weight Activator Hy 5162

Procedure

The resin must be stirred well in spite of its little sedimentation tendency, before making use of it. Then the apt activator can be added and must be mixed thoroughly. If fine contours are to be formed of it, before pouring either a special surface coat of the resin or a thin layer of the casting resin/activator mixture must be applied on the mould surface by using a short-bristled brush. The resin/activator mixture must continuously be cast along the mould wall or along a spatula into the deepest location of the mould. By a slow and even pouring occlusions of air can be avoided to a great extent.

Storability

Araldite CW 2418 and Activator Hy 5162 must be stored at 18 – 25 °C, must always stay well closed and be kept in dry circumference, if possible in original packages. Under these conditions the storability conforms to the times designated in the product description.

Industrial hygiene

As with many chemicals it is necessary to act in accordance with the recommendations for industrial hygiene also with regard to the handling of epoxy resins and activators.

3 cans of resin CW 2418 à 1.000 kg 3.000 kg
3 cans of activator Hy 5162 à 0.150 kg 0.450 kg
Order number **SZ 9703**

1 can of resin CW 2418 13.500 kg
1 can of activator Hy 5162 2.000 kg
Order number **SZ 9703.04**

10 tubes of resin CW 2418 à 0.100 kg 1.000 kg
10 tubes of activator Hy 5162 à 0.015 kg 0.150 kg
without a tube fork
Order number **SZ 9716**

1 tube of resin CW 2418 100 g
1 tube of activator Hy 5162 15 g
without a tube fork
Order number **SZ 9718**

1 tube fork
Order number **SZ 9730**

Separating fluid QZ 5111 0.750 kg
Order number **SZ 9704.1**

Application!

It is necessary to shake product before use. Use a brush or cloth to apply to parts several times in 10–15 minute intervals, let dry, and polish with a soft cloth.
Allows a trouble-free separation or removal of molded parts or laminates of ARALDIT from pore-free forming materials: ARALDIT, UREOL, metal, glass, porcelain, etc.

Warning!

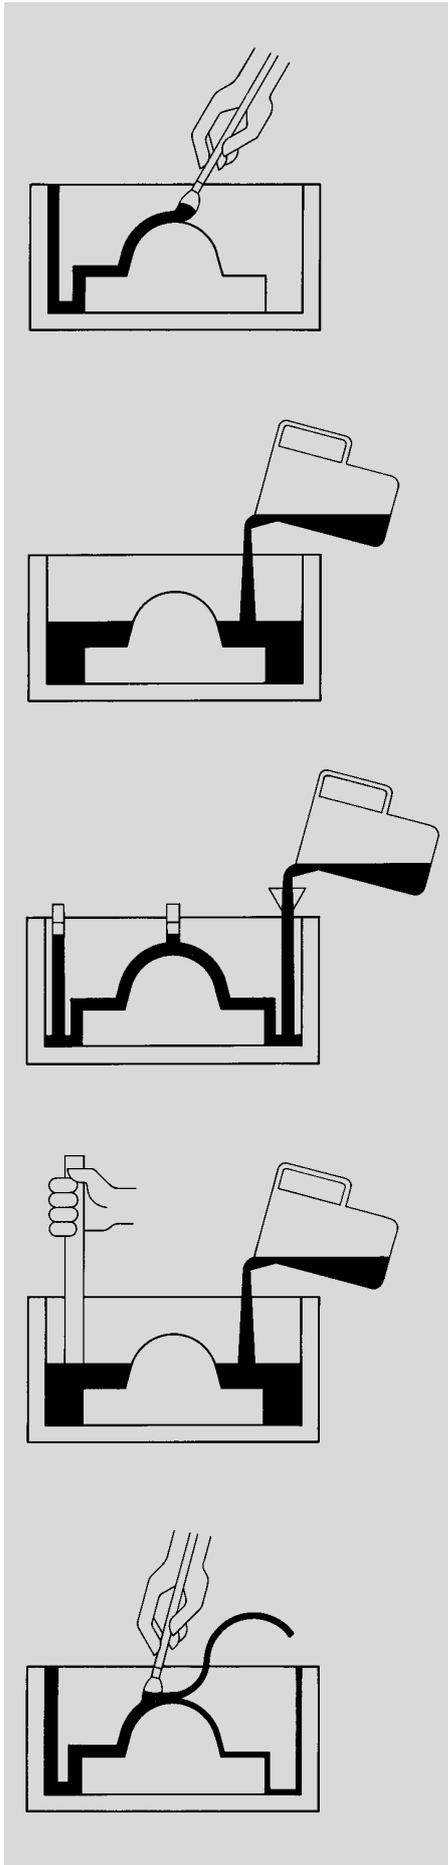

Separating fluid QZ 5111 is combustible.

Introduction

The construction of foundry models, templates, fixtures, moulding and tolerance gauges a.o. foundry devices by making use of model resin Araldit CW 2215 has the following advantages:

- Quick manufacture with simple means
- Excellent constancy to form and permanency to dimension of the end product
- Excellent sturdiness, little wear
- Little weight
- Easy to change, quick to repair, practical to make up

In tool and model manufacture four simple basic working methods resp. mounting procedures are applied depending on the type of the workpiece and its usage:

- Creating the surface coat
- Casting
- Backfilling
- Laminating

Basic models and their pre-treatments

Master or gauge patterns of high precision are required for manufacturing model devices out of Araldit CW 2215. Their surface quality has a decisive influence upon the surface smoothness of the negatives and of the model devices.

The extraordinary adhesive force of Araldit CW 2215 on almost all materials must be compensated by an appropriate pretreatment of the basic models with sealing and using the separating agent QZ 5111 (SZ 9704).

Thereby the well hardened models can be perfectly be removed from the moulds. In case of porous surfaces (f. e. wood) several layers should be applied for reasons of expediency. Each layer must dry for a short time, the last layer should be polished with a soft cloth or cotton wad in order to obtain a blank surface on the to be cast workpiece. Basic models can be made out of all usual model materials such as f.e. wood, gypsum, metal, concrete and epoxy araldite resin

Set-up methods

Surface coats:

A surface coating is applied with a short cut brush onto the pretreated basic models or is cast between negative and too low sized core. This coating makes a flexible until hard surface with a high edge tear resistance allowing a precise shaping of finest contours.

The surface layers are backed up by cast model resin or are lined up by a high-fill model resin mass, depending on the usage of the production equipment of concern.

Full mould casting:

Pretreated moulds can be cast out directly with Araldit CW 2215. This full mould casting method is suited for manufacturing screw-on models and negatives up to layer thicknesses of 20 mm at maximum.

Front mould casting:

With this method a too low sized core of metal or araldite epoxy resin is required. This core is fixed according to the desired front layer thickness in the negative form with keeping a distance of 12-18 mm all the way around where the casting resin is cast.

Backfilling:

Big quantities of filling materials are mixed into the model resin. This resin/activator/filler mixture is cast into the moulds provided with surface coat and coupling layer or laminate or is rammed. As filling materials various sorts can be used: silica sand, aluminium grit etc. Backfill masses of silica sand reach highest resistance to pressure whereas admixtures of aluminium grit work out as backfillers which are well to treat and dissipate the heat. To facilitate the treatment of model devices on the reverse side an additional well treatable casting resin layer of Araldit CW 2215 is cast on in a thickness of approx. 5 - 10 mm.

Laminating:

When laminating, glass fabric is perfused thoroughly with laminating resin by means of a stiff-bristled brush, a ductor blade or a special laminating hook and is built up in layers until the required mould shell is reached.

Instead of the time consuming set-up of a laminate shell out of several glass fabric layers a shell can be made in one work cycle in an economical way by using araldite laminating pasters.

Model resin

Model resin Araldit CW 2215

A light-beige fluid epoxy resin system filled with minerals for layer thicknesses up to 20 mm designated for the manufacture of models, gauges and devices.

Fields of application:

Manufacture of foundry and copy-milling models, screw thread models, core boxes, dimension gauges, moulding plates.

Set-up methods

Full mould casting
Front mould casting

Characteristics

Light-beige fluid casting resin
Hardening in room temperature
Little sedimentation
Excellent casting properties
Layer thickness up to approx. 40 mm can be cast in one work cycle.
Inkable with araldite colour pastes
Easy to treat mould material

Product description of Araldit CW 2215

Modified epoxy resin with mineral filler
Supplied type: light-beige paste
Viscosity at 25 °C: 80.000 – 140.000 mPa.s
Density: 1,7 g/cm³
Flash point (Pensky-Martens): 135 °C
Storability at 18 – 25 °C: 1 year

Activator Hy 5161

Formulated polyamino-activator for layers in thicknesses up to 20 mm at max., especially designed for cutting die guides.
Supplied type: clear, light yellow liquid
Viscosity at 25 °C: 30 – 70 mPa.s.
Density: 1,0 g/cm³
Flash point (Pensky-Martens): 162 °C
Storability at 18 – 25 °C: 1 year

Ratio of components

100 parts by weight of resin Araldite CW 2215
20 parts by weight of Activator Hy 5161

Work-up

The resin must be stirred well in spite of its little sedimentation tendency, before making use of it. The the apt activator can be added but must be mixed thoroughly. If fine contours are to be formed of it, before the casting is done either a special surface coat of the resin or a thin layer of the casting resin/activator mixture must be applied on the mould surface by means of a short-bristled brush.

Storage

Araldit CW 2215 and Activator Hy 5161 must be stored at 18 – 25 °C, must be always stay well closed and kept in a dry place, if possible in original packages. Under these conditions the storability conforms to the times as designated in the product description.

Industrial hygiene

As with many chemicals it is necessary to act in accordance with the recommendations for industrial hygiene also with regard to the handling of epoxy resins and activators.

6 cans of resin CW 2215 à 0,750 kg 4.500 kg
6 cans of activator Hy 5161 à 0,150 kg 0.900 kg
Order number **SZ 9720**

1 can of resin CW 2215 10.000 kg
1 can of activator Hy 5161 2.000 kg
Order number **SZ 9720.2**

3 cans of resin CW 2215 à 0,750 kg 2.250 kg
3 cans of activator Hy 5161 à 0,150 kg 0.450 kg
Order number **SZ 9722**

Separating fluid QZ 5111 0.750 kg
Order number **SZ 9704.1**

Application:

It is necessary to shake product before use. Use a brush or cloth to apply to parts several times in 10–15 minute intervals, let dry, and polish with a soft cloth. Allows a trouble-free separation or removal of molded parts or laminates of ARALDIT from pore-free forming materials: ARALDIT, UREOL, metal, glass, porcelain, etc.

Warning!

Separating fluid QZ 5111 is combustible

Rush-type hand guns

Hand-lever grease press

Rush-type hand guns

similar to DIN 1282

with pointed mouth piece for funnel-type lubricating nipple incorporate in guides.

Contents 60 cm³

Conveyed quantity per stroke: approx. 0.7 cm³

Order example: Rush-type hand gun
SZ 9800

Order number **SZ 9800**

Hand-lever grease press

Characteristics:

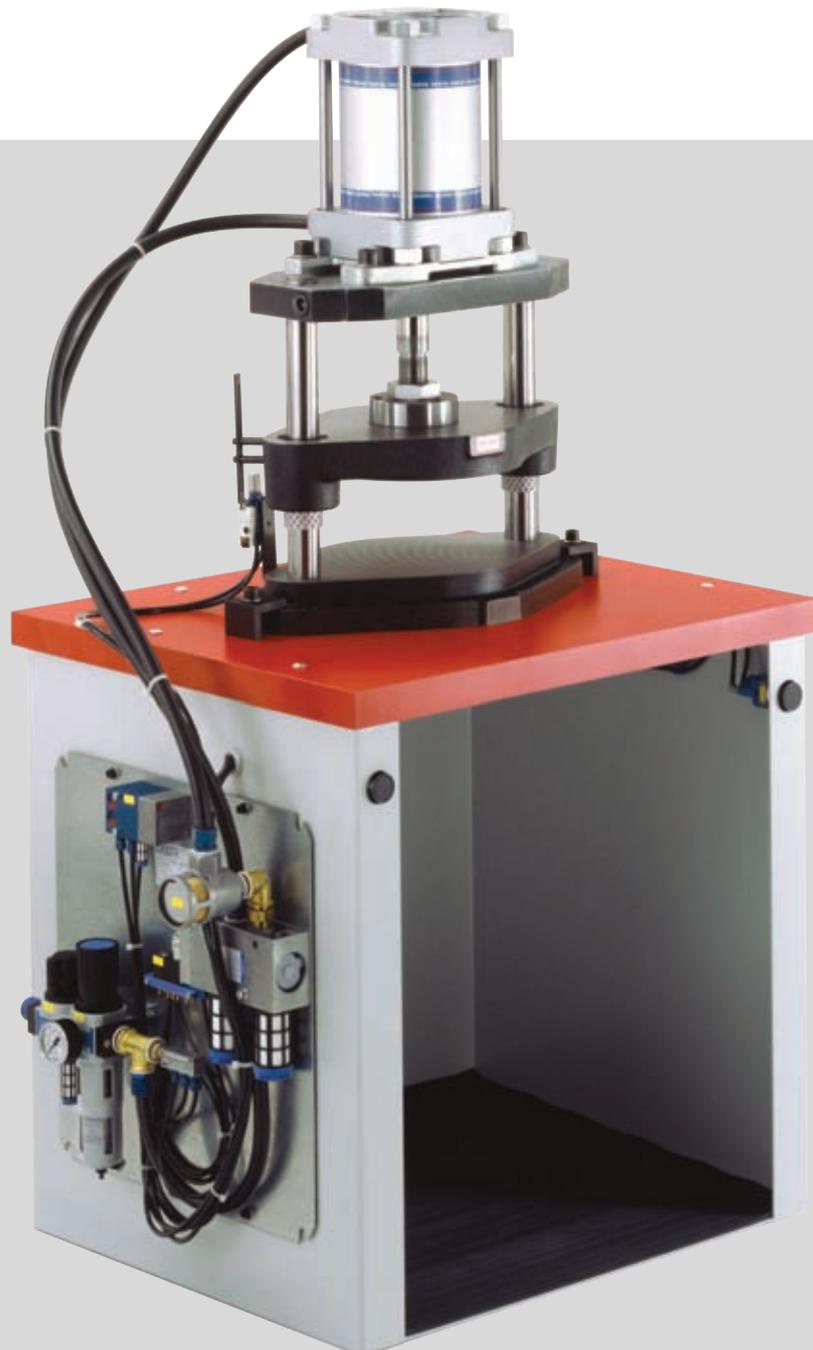

- Constructed all of steel
- Possible to lubricate every opening
- No wear parts in high-pressure section
- Secure piston rod fastening
- Universal filling possibilities
- Suitable for grease cartridges

Suitable grease cartridge: SZ 9005 and
SZ 9006

Order number **SZ 9810**

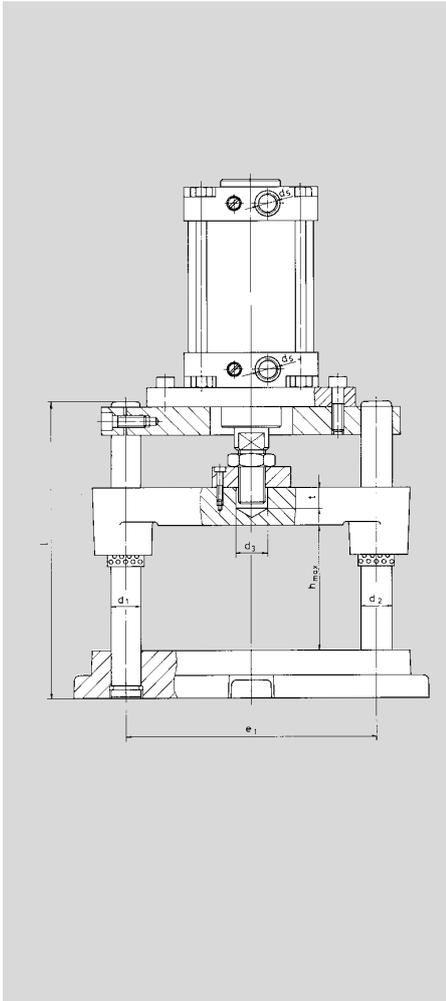

Mechanical equipment

- Pneumatic stamping-unit
- Hand-toggle-lever presses

Pneumatic-stamping-units

with die-sets made of special grey cast iron

Pneumatic-stamping units consisting of die-sets with ball guide, traverse, threaded flange and pneumatic cylinder

Application:

Cutting, bending, trimming, riveting, flanged and assembly working operations

Description:

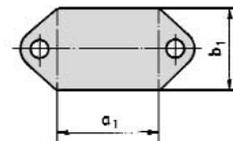

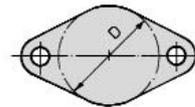

The traverse will be clamped to the pillars above the die sets upper plate and of use for the attachment of the pneumatic cylinder. The piston rod of the pneumatic cylinder is fastened onto the die-sets upper plate by help of the threaded flange.

Order example: Pneumatic-stamping-unit with die-set made of special grey cast iron with round working surface **ST 1092**

D = 200 mm

Add **200**

Order number **ST 1092.200**

Toggle-lever presses

compressive force 2.5 kN – 16 kN

Characteristics

High compressive force from 2500 up to 16000 N with only little force needed at the hand lever. Large ram stroke resp. slide stroke. The whole toggle-lever unit is adjustable in the height by a threaded spindle, adjustment with a setscrew. Work table with T-slot mounting for tool attachment. Clearance bore-hole in the middle of the table. Compact and stable type of construction, little space required.

Special technical features

The hand lever, which can be adjusted 360° and thereby allows for the easiest lever movement for any assembly process.

Return stroke blocking mechanism

for toggle-lever presses 2.5 kN – 8/16 kN

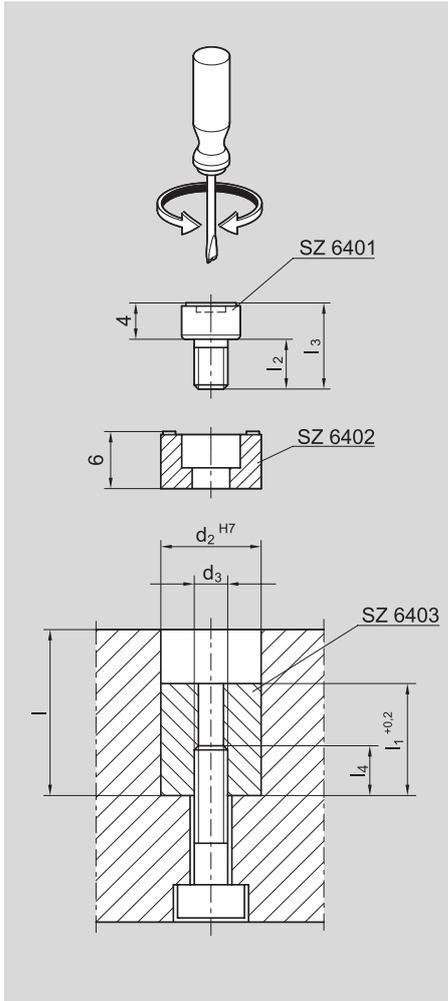

When precise embossing, bending, riveting and cutting work is of importance, the return stroke blocking mechanism guarantees that the ram reaches the exact bottom dead center.

The return stroke safety is triggered 8 mm before the ram reaches the bottom dead center.

After a complete stroke cycle, only about 18 mm return stroke is necessary. This corresponds to pulling the hand-lever back 60° in order to be able to start the next stroke.

The blocking mechanism can easily be locked and unlocked as required. Subsequent installation is possible without any problems.

Embossing stamp SZ 640.

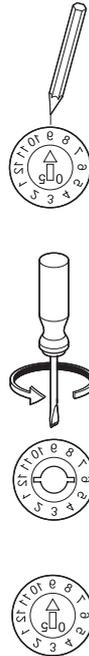

Assembly instruction:

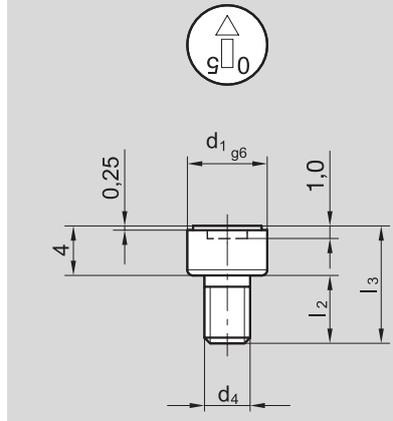

Assemble the embossing stamp and mark the direction of the arrow.

Screw out the inner embossing stamp SZ 6401 and turn the inserts SZ 6402 into the marked position.

Screw the inner embossing stamp SZ 6401 and check the correct position.

Scrap Transporter SZ 8800

Pneumatic

Application:

The pneumatic scrap transporter is used to transport parts and dispose of scraps. The stamped parts and scraps are transported by vibration out of the tool. The transfer tray is adjusted and screwed on to serve as the parts transporter.

Transfer trays can be made according to your drawings. Price and delivery upon request.

Special Features:

- Low air consumption
- Maintenance-free
- Noiseless
- Low production costs

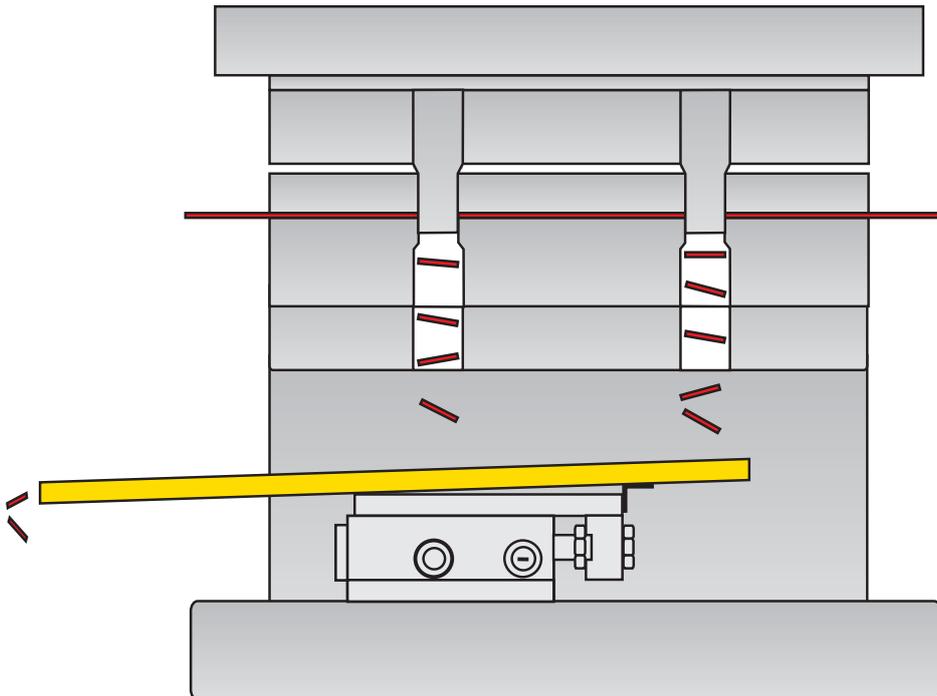

Order example: Scrap transporter **SZ 8800**

JOLLYCAM[®] Combination Hydraulic Slide (registered patent)

Type A

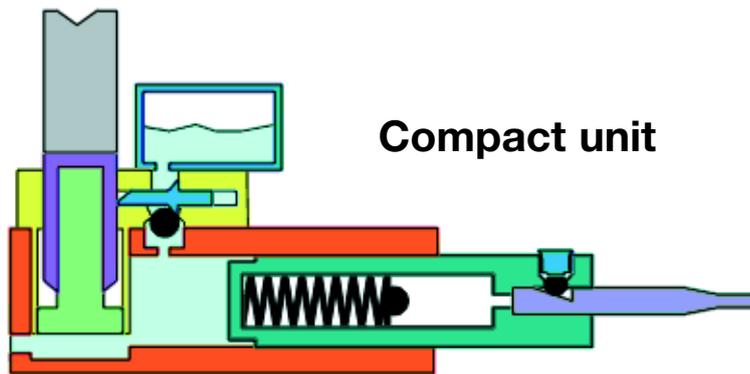

Type B

Type A sz 8600

Combination Hydraulic Slide

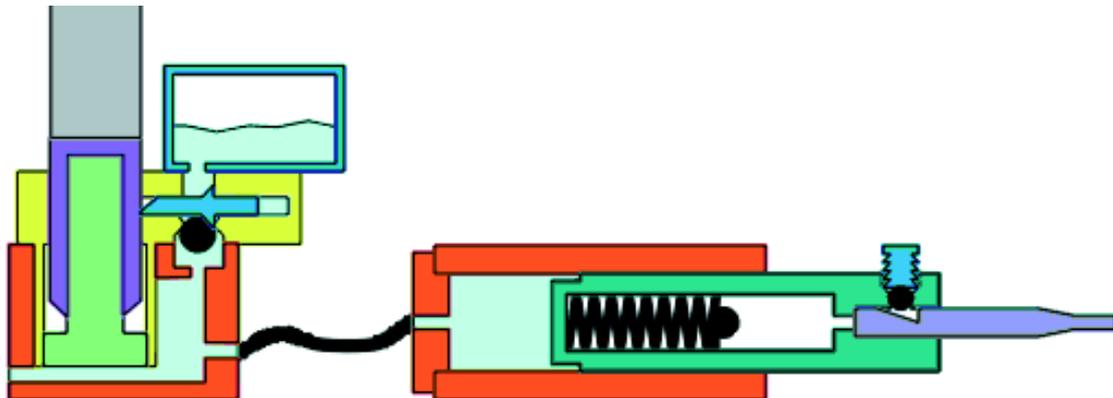

This compact unit is used where lateral perforation, punching and similar operations are necessary. The slide operates in the final phase of the downward movement and the initial phase of the upward movement of the tool. Slide retraction is realised by a built-in helical compression spring. Slide movement is horizontal.

Type B sz 8610

Pressure Cylinder with External Slide

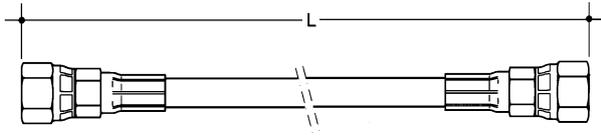

The pressure cylinder is utilised to actuate the freely-positionable slide. The slides are connected to the pressure cylinder by a pressure hose line and can thus be fitted in any position or angle on the tool.

Caution: Type B is supplied in an assembled state (pump + hose + slide), completely screwed together and aerated.

Please do not remove the hose, as air will otherwise penetrate the oil circuit and the functionality of the unit can no longer be ensured.

Dismantling necessary for repairs is not easy and should only be carried out by skilled personnel. Repairs can be carried out at our facility.

Hoses for Type B

Hose	DA
1/4"	13,2
3/8"	17,2

Please give the hose length for Type B as well when ordering.

110 x 025 110 x 050	25 50	10	200	500

Remark:

- ① The forces specified apply at a pressure of approx. 250 bar.
- ② The retraction springs cannot be used for stripping.
Always use an urethane or rubber stripper for this purpose.

**The compact unit and slide can be supplied with a gas retraction spring for greater retraction forces.
(Price and delivery date available on request)**

Maximum working temperature: 70 °C
Maximum stroke speed: 10 m/min.

JOLLYCAM® SZ 8600

Type A Compact Unit

STEINEL
NORMALIEN

Combination Hydraulic Slide

Function:

The slide operates in the final phase of the downward movement and the initial phase of the upward movement of the tool.

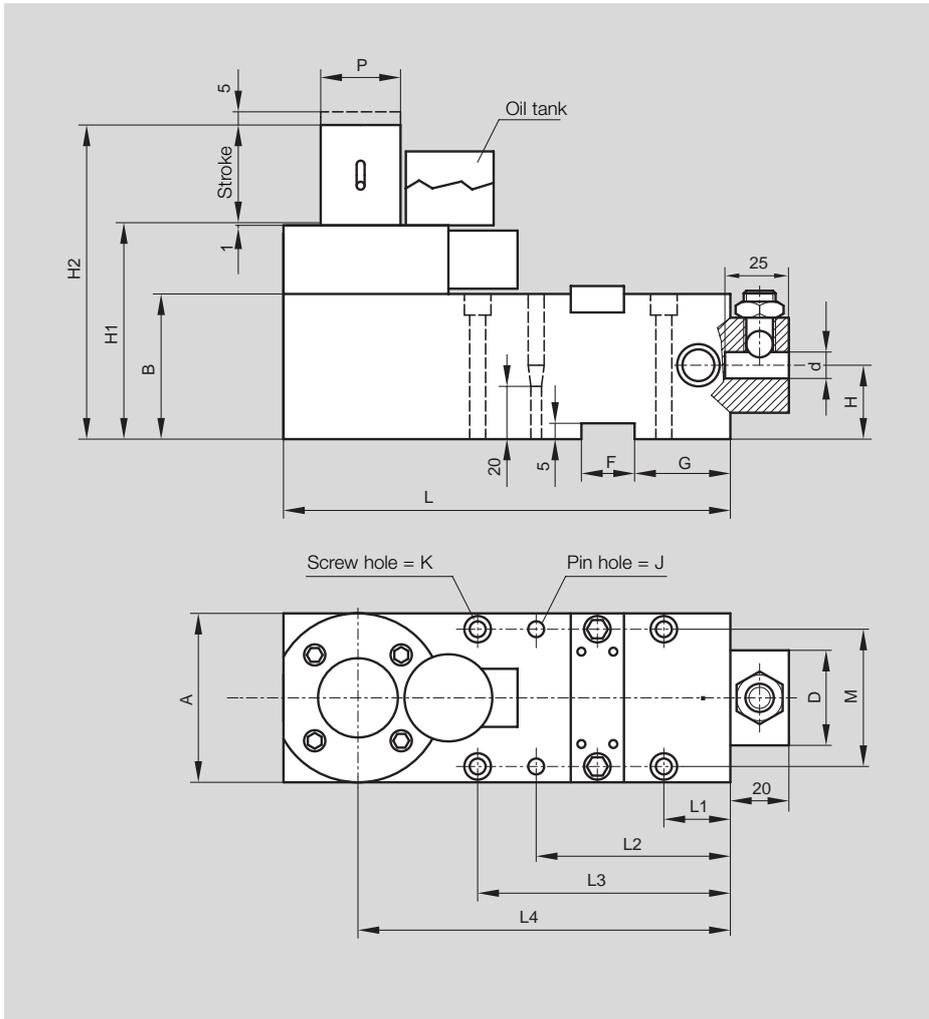

Tool stroke = Slide stroke

Slide retraction: helical compression spring

Application:

Bending, embossing, beading, trimming, perforation, etc.

Price and delivery date available on request.

Order example: Type 1A SZ 8600

combination hydraulic slide with a width of A = 80 mm and stroke of 25 mm

Add: **080 x 025**

Order number **SZ 8600.080 x 025**

JOLLYCAM® SZ 8610

Type B Pressure Cylinder with External Slide

Pressure Cylinder with External Slide

Function:

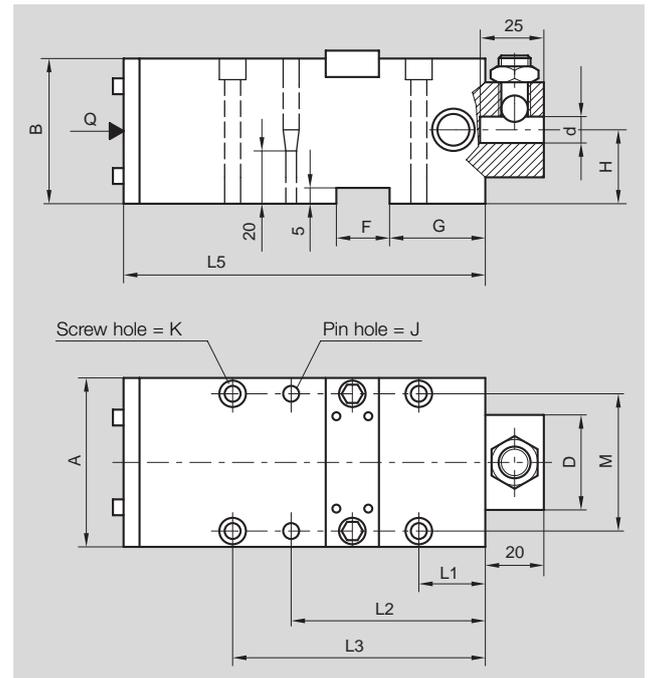

The pressure cylinder is utilised to actuate the freely-positionable slide. The slides are connected to the pressure cylinder by a pressure hose line and can thus be fitted in any position or angle on the tool.

Order example: Pressure cylinder with Type B **SZ 8610** slide, with a width of A = 80 mm and stroke of 25 mm

Extension: **080 x 025**

Order number: **SZ 8610.080 x 025**

Please state the required hose lengths as well!

Pilot Pin Unit SZ 4540

STEINEL®
NORMALIEN

Pilot Pin Unit

Features:

This pilot pin unit is a combination of a pilot pin with a spring-loaded stripper in a compact design.

Application:

This unit will be primarily used in large tools for the manufacture of sheet metal stamped parts. The sheet metal part is stripped by means of an integrated compression spring.

Order example: Pilot pin unit **SZ 4540**

$d_1 = 12 \text{ mm}$

Поставки промышленного оборудования

Системы линейного перемещения:

- линейные подшипники
- линейные направляющие
- прецизионные валы
- линейные модули
- координатные столы
- системы позиционирования
- шариковинтовые передачи (ШВП),
и роликвинтовые передачи (РВП),
стандартизованные и по чертежам
заказчика, опоры к ШВП и РВП
- линейные приводы и актуаторы
- электромеханические приводы

Сборочные технологии:

- модульные системы профилей

Прецизионное оборудование:

- шпиндели

Промышленные вентиляторы:

- центробежные вентиляторы низкого,
среднего и высокого давления
- осевые вентиляторы
- калориферы
- канальные вентиляторы
- вентиляторы отводного канала
- крышные вентиляторы
- бытовые вентиляторы

Другая продукция:

- опорно-поворотные устройства
- шариковые опоры
- уплотнения, муфты, ремни, шкивы
- другая продукция промышленного
назначения
