The Mark of Linear Motion

Caged Ball™

SNR/SNS Caged Ball LM Guide

Ultra-rigid LM Guide® for Machine Tools

- High speed performance
- Low noise design
- Reduction in rolling resistance variation
- Fitting measurements according to DIN 645
- Long-term maintenance-free operation
- Radius of curvature 51% Da

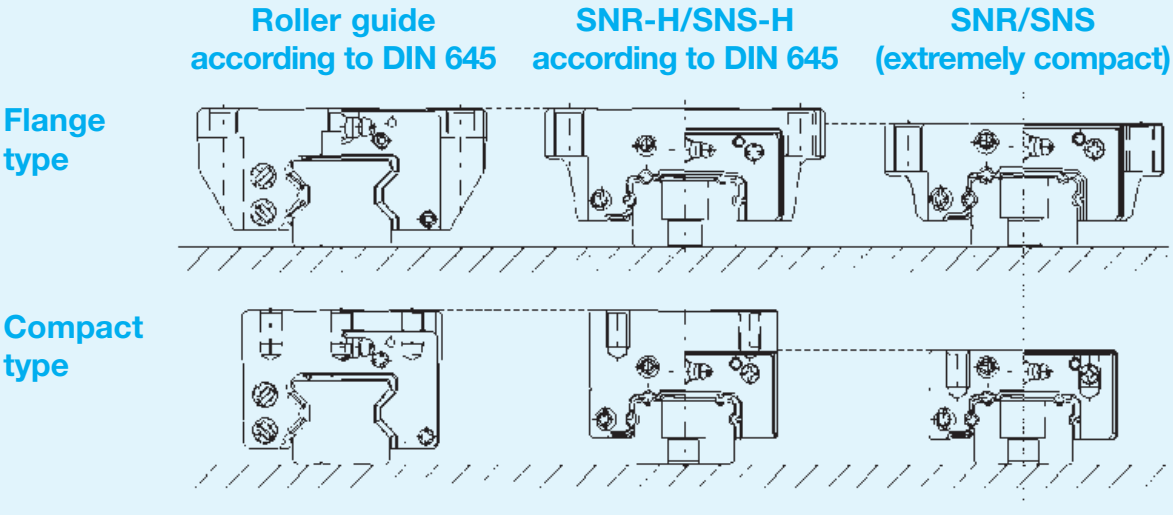
load rating type
SNS

Figure 1 Structure of types SNR/SNS

Fitting measurements also according to DIN 645

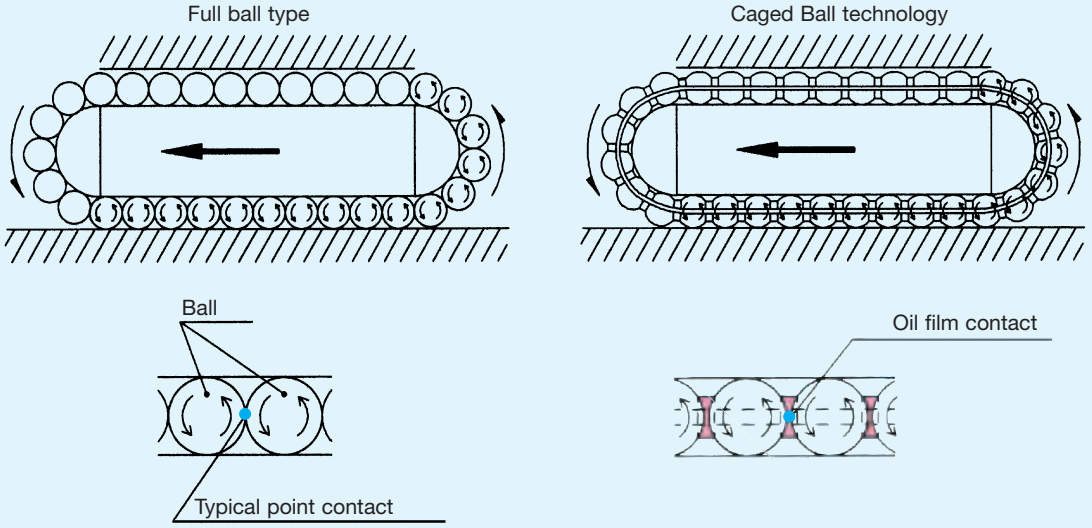
The fitting measurements of the types SNR-H and SNS-H meet the standard DIN 645. Therefore, these types are compatible with all standard roller as well as ball type linear motion guides. For very compact machine designs the extremely compact linear guides SNR and SNS are the best solutions.



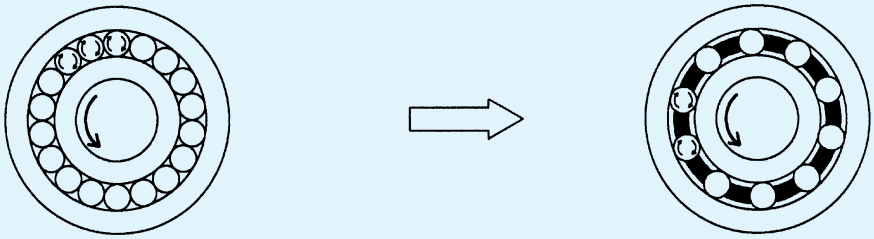
SNR/SNS
CAGED BALL LM GUIDE

Elimination of Ball-Friction with Caged Ball™ technology

Linear motion guide



Rotary ball bearing



In the first stage of development (Full ball type)

- Adjacent balls contact each other at a point. As a result, the contact stress is large and the oil film brakes down due to friction.
- The life becomes shorter.

Present bearing (With ball cage)

- The life is extended due to the absence of friction.
- Heat generation during high-speed rotation is limited due to the absence of the friction between adjacent balls.
- The balls do not contact each other. Noise does not arise from the metal to metal contact.
- Balls move smoothly because they are positioned evenly.
- The lubricating oil retained between the balls provdes excellent lubrication and long life.

At the time rotary ball bearings were invented, they had no ball cages. This resulted in loud noise during operation, a short running life, and did not have the ability to be run at high speeds.
20 years later, rotary ball bearings with ball cages were developed. This type was quieter in operation and capable of high rotational speeds. Although containing less balls, it provided exellent running life and contributed to the major success of rotary bearings.
The history of the needle bearing reveals how quality improved through the use of ball cages. Balls, at their point of contact, slip against each other in opposite directions and at twice the speed of each of their rotation. This resulted in severe wear, loud noise, and a short running life. The massive pressure from the metal to metal contact and slip between the balls also caused the oil film to break down.
Alternatively, balls and ball cage contact each other over a large surface area and at half the relative velocity. This prevents the break down of oil and provides for quieter operation, higher rotational speeds, longer running life and extended maintenance.

At THK , we utilized our many years of experience along with innovative manufacturing techniques to develop the new Caged Ball™ technology, and we have built this technology into the new generation of smooth-running LM guides. The main features of the new LM guides are as follows.

1 Low Noise - Favorable Sound Quality

Since the balls move in an orderly manner due to the presence of the ball cages, the metallic sound produced by collision between adjacent balls is eliminated, thereby resulting in low noise levels and favorable sound quality.

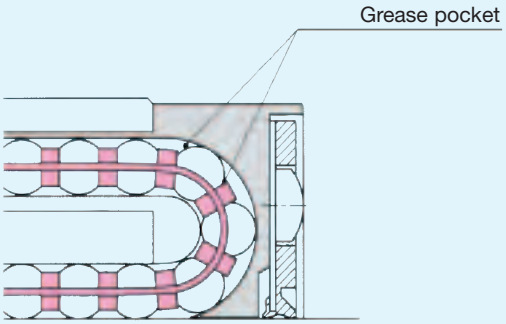


Figure 2 Ball circulating section

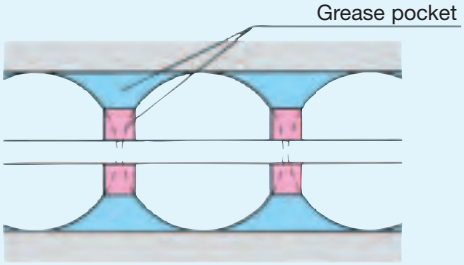
2 Long Service Life, Long-term Maintenance-free Operation

Adjacent balls, separated by the ball cage, do not rub against each other and produce friction. As a result, the balls are not subject to wear and tear. In addition, the grease retention has been enhanced, providing long service life, long-term maintenancefree operation.



The grease circulates with the aid of a ball cage.

Figure 3 Grease pocket

3 Excellent High-speed performance

Caged Ball LM Guides exhibit excellent high-speed performance through reduced heat generation due to lower bearing stress and half the ball contact velocity. The life of the balls is also prolonged due to the elimination of the friction and wear between adjacent balls.

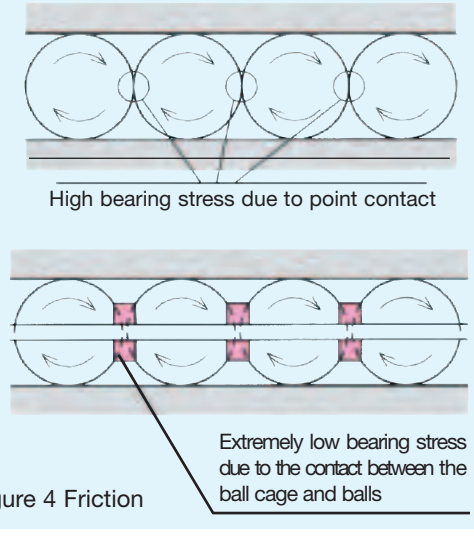


Figure 4 Friction

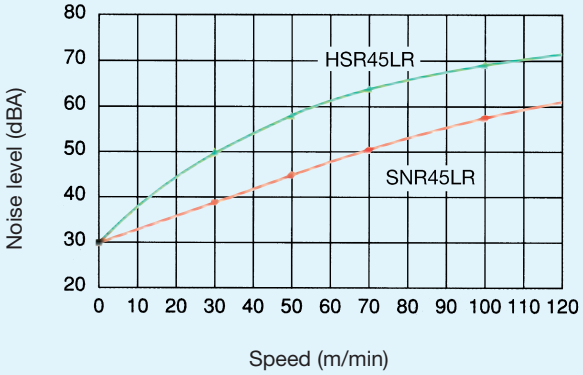
4 Super Smooth Movement

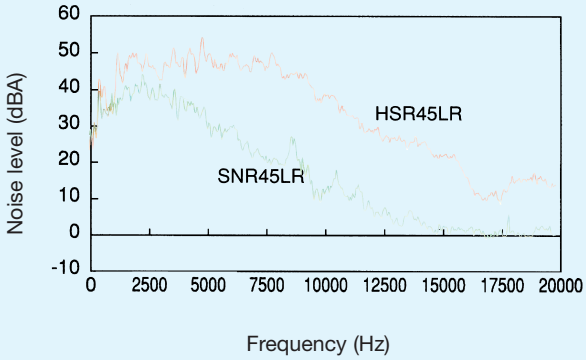
Smooth movement with less variation of torque can be obtained as the balls are lined uniformly and circulated.

Noise level data

The types SNR/SNS have ball-circulating sections made of resin molded in the block. This structure eliminates metallic noise caused by balls contacting the block. The use of a ball cage has also eliminated metallic noise produced by balls hitting each other. Thus, types SNR/SNS operate quietly even at high speed. In addition, a ball cage is effective in preventing balls from rubbing against each other, resulting in low heat generation and a super high speed performance.



Comparison of the noise levels of SNR45LR and HSR45LR



Comparison of the noise levels of SNR45LR and HSR45LR (Speed: 100 m/min)

Less variation of rolling resistance

Types SNR/SNS are equipped with ball cage that uniformly arranges the balls. This enables the balls to move in a straight line without meandering when they enter the block. The balls can move smoothly regardless of the mounting position, decreasing the variation of rolling resistance and enabling a high degree of accuracy.

Variation in Rolling Resistance HSR45LR (full ball type)

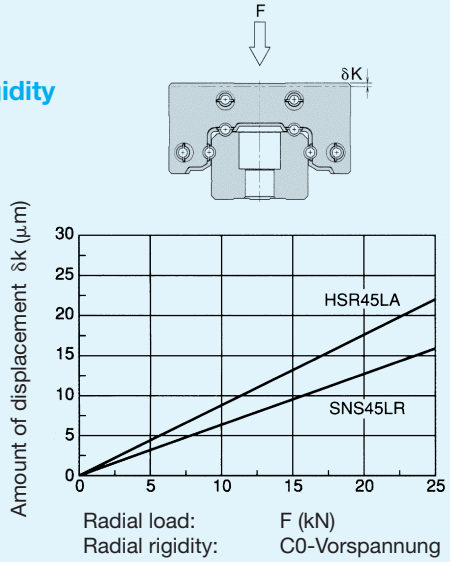
SNR/SNS
CAGED BALL LM GUIDE

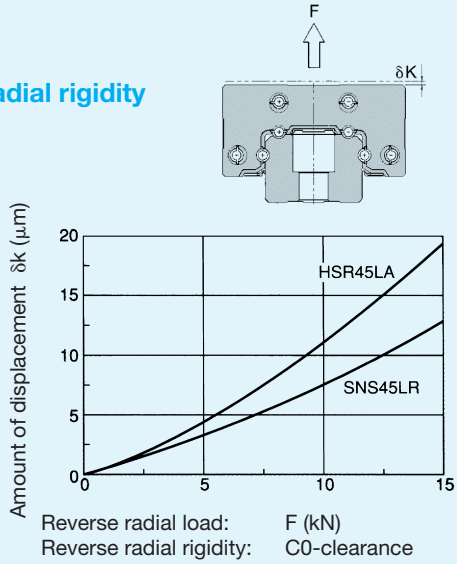
Special Quality of Type SNR and SNS

High rigidity
Types SNR/SNS are compact linear motion products based on the design of the LM Guide type NR, but with increased block rigidity. Since the radial rigidity, reverse radial rigidity, and lateral rigidity were all increased, types SNR/SNS have the highest rigidity in the Caged Ball series. The two types are available in the same dimensions: type SNR for the radial load type and type SNS for the four way equal load rating type. Either may be selected according to your application.

Radial rigidity



Reverse radial rigidity



Improvement of damping effect
During rapid traverse movement, the LM Guide moves smoothly with almost no differential slip, and achieves high positioning accuracy. During heavy cutting and slow movement, the proper differential slip according to cutting load is generated. As a result, it increases frictional resistance and improves the damping effect (damping characteristics).

Ultra-heavy load specifications
The radius of curvature of the raceway is very similar to the ball radius so that the contact area, when subject to a load, is no less than the contact area of a roller type. This allows the new LM Guide to have a higher load carrying capacity than the roller type. They do not suffer a locking phenomenon due to the skewing of the rollers, which often occurs to the roller type.

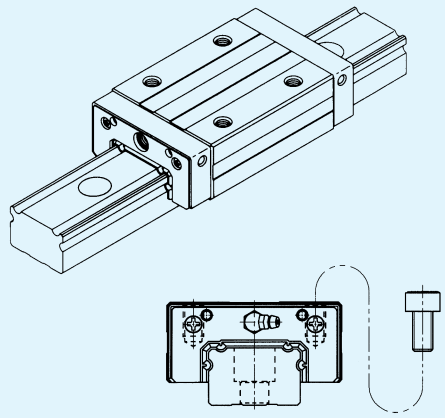
Wide variety of options
Since various options such as the end seal, cover plate and bellows are available, the LM Guide can accomodate a variety of specifications.

SNR/SNS
CAGED BALL LM GUIDE

Types and Features

SNR-RH/SNS-RH
SNR-R/SNS-R

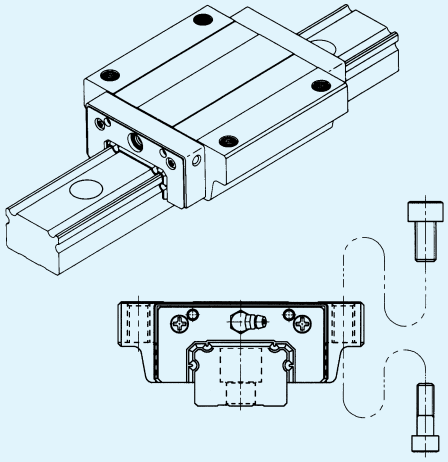
Compact type



Type SNR-R has a narrow block. Threads are tapped in the block. It is used when the installation space is limited. The fitting measurements are based on DIN 645.

SNR-CH/SNS-CH
SNR-C/SNS-C

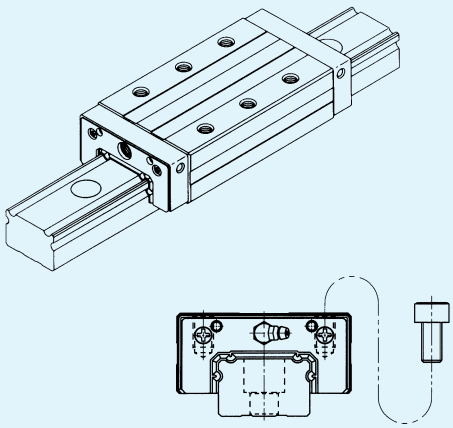
Flange type



The block of type SNR-C has flanges which are tapped from the top and counterbored from below. The fitting measurements are based on DIN 645.

SNR-LRH/SNS-LRH
SNR-LR/SNS-LR

Compact type

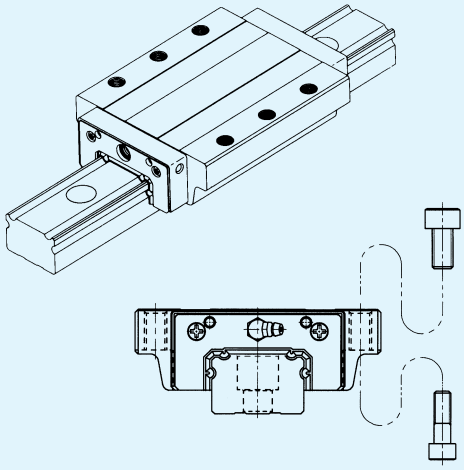


LM block threaded holes:
SNR-LR/SNS-LR 6 pcs.
SNR-LRH/SNS-LRH 4 pcs.

Type SNR-LR has the same cross section as type SNR-R. With the increased number of balls, it is for handling ultra-heavy loads. The fitting measurements are based on DIN 645.

SNR-LCH/SNS-LCH
SNR-LC/SNS-LC

Flange type



LM block threaded holes:
SNR-LC/SNS-LC 6 pcs.
SNR-LCH/SNS-LCH 4 pcs.

Type SNR-LC has the same cross section as type SNR-C. With the increased number of balls, it is for handling ultra-heavy loads. The fitting measurements are based on DIN 645.

Load Ratings and Life

Types SNR/SNS can support loads in the radial, reverse radial and lateral directions.
The basic load ratings listed in the dimension tables show the load ratings in the radial direction.

Life calculation

The following equation gives the life of types SNR/SNS.[1)]

$$L = \left(\frac{f_T \cdot f_C}{f_W} \cdot \frac{C}{P_C} \right)^3 \cdot 50$$

L : Rated life (km)
Die nominelle Lebensdauer L ist statistisch als die Gesamtlaufstrecke definiert, die 90% einer größeren Menge gleicher Führungen unter gleichen Betriebsbedingungen erreichen oder überschreiten, bevor erste Anzeichen einer Werkstoffermüdung auftreten.
C : Basic dynamic load rating (N)
P_C : Design load (N)
f_T : Temperature factor
f_C : Contact factor
f_W : Load factor

Given rated life(L) calculated by the above equation and assuming that the length of stroke and the reciprocating rate are constant, the life in terms of time can be calculated by using the following equation.

$$L_h = \frac{L \cdot 10^3}{2 \cdot \ell_S \cdot n_1 \cdot 60}$$

L_h : Life in terms of time (hr) (h)
ℓ_S : Stroke length (m)
n_1 : Number of reciprocating motions per minute (min^{-1})

Load Ratings in Various Directions

Load ratings

Types SNR/SNS can support loads in the radial, reverse radial and lateral directions. The basic load ratings listed in the dimension tables show the load ratings in the radial direction. The reverse radial and lateral load ratings are obtained from the table.

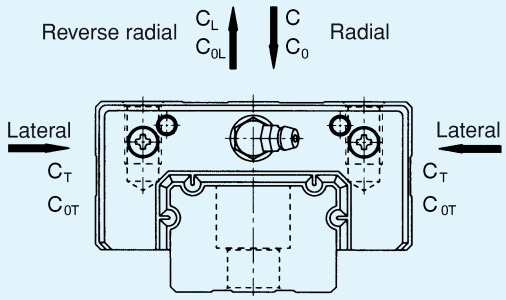


Figure 5 Load ratings in various directions

Table 1 Load ratings of types SNR/SNS in various directions

Direction	SNR		SNS	
	Basic dynamic load rating	Basic static load rating	Basic dynamic load rating	Basic static load rating
Radial	C	C_0	C	C_0
Reverse radial	C_L=0,64C	C_{0L}=0,64C_0	C_L=0,84C	C_{0L}=0,84C_0
Lateral	C_T=0,47C	C_{0T}=0,38C_0	C_T=0,84C	C_{0T}=0,84C_0

Equivalent load

When the LM block of type SNR is subjected to reverse radial and lateral loads simultaneously, the equivalent load can be calculated by using the following equation.

$$P_E = X \cdot P_L + Y \cdot P_T$$

P_E : Equivalent load
·Reverse radial
·Lateral (N)
P_L : Reverse radial load (N)
P_T : Lateral load((N)
X, Y : Equivalent factors (Table 2)

Table 2 Equivalent factors of type SNR

	P_E	X	Y
$P_L/P_T \geq 1$	Reverse radial equivalent load	1	1,678
$P_L/P_T < 1$	Lateral equivalent load	0,596	1

When the LM block of type SNS is subjected to radial and lateral loads, reverse radial and lateral loads simultaneously, the equivalent load can be calculated by using the following equation.

$$P_E = X \cdot P_R (P_{L)} + Y \cdot P_T$$

P_E : Equivalent load (N)
· Radial
· Reverse radial
· Lateral

P_R : Radial load (N)
P_L : Reverse radial load (N)
P_T : Lateral load (N)
X, Y : Equivalent factors (Table 3,4)

Table 3 Equivalent factors of type SNS
(in case of radial load and lateral load are applied)

	P_E	X	Y
$P_R/P_T \geq 1$	Radial equivalent load	1	0,935
$P_R/P_T < 1$	Lateral equivalent load	1,070	1

Table 4 Equivalent factors of type SNS
(in case of reverse radial load and lateral load are applied)

	P_E	X	Y
$P_L/P_T \geq 1$	Reverse radial equivalent load	1	1,020
$P_L/P_T < 1$	Lateral equivalent load	0,986	1

Radial Equivalent Load M_0

Types SNR/SNS can take moment load in all three directions with only one LM block. Tables 5 and 6 list the values for the permissible moment load with one LM block in three directions.

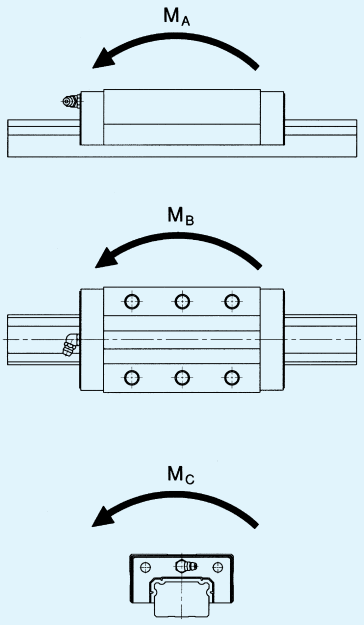

Figure 6 Moment load

Accuracy Standard

Tables 7 shows the accuracy of types SNR/SNS. Accuracy is defined by the running parallelism and tolerances of height and width. When two or more LM blocks are installed on one rail or when two or more rails are specified as matched sets, accuracy is defined by the differences in height and width of the individual LM blocks.

Running parallelism

For details, see General Catalog.

Difference in height M

For details, see General Catalog.

Difference in width W2

For details, see General Catalog.

The accuracy of types SNR/SNS is classified into normal, high, precision, super-precision and ultraprecision grades as shown in Table 7.

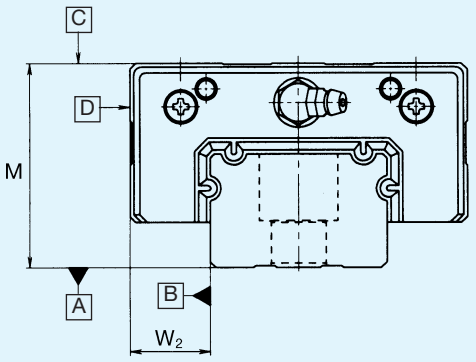

Figure 7 LM block surface

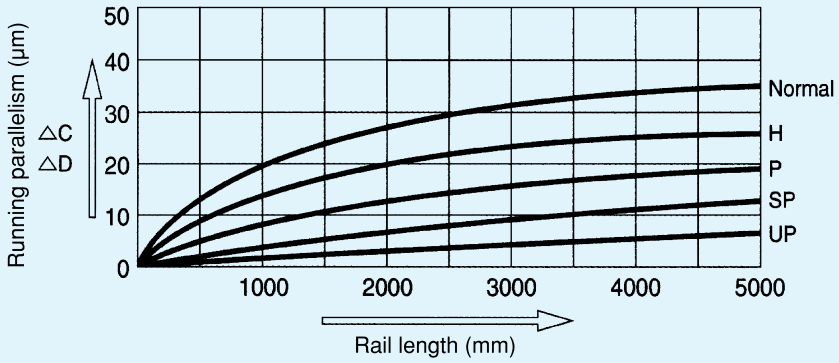

Figure 8 LM rail length and running parallelism

Preload

Table 8 lists the preload according to the radial clearance of the types SNR-H/SNS-H and SNR/SNS. Preloaded LM Guides generally have a negative radial clearance.

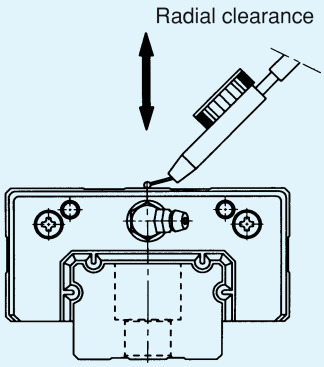

Figure 9 Measurement of the radial clearance

Table 8 Radial clearance of types SNR/SNS Unit: μm

Symbol / Model No.	Normal —	Light preload C1	Medium preload C0
SNR/SNS25	0 ~ −3	−3 ~ − 6	− 6 ~ − 9
SNR/SNS30	0 ~ −4	−4 ~ − 8	− 8 ~ −12
SNR/SNS35	0 ~ −4	−4 ~ − 8	− 8 ~ −12
SNR/SNS45	0 ~ −5	−5 ~ −10	−10 ~ −15
SNR/SNS55	0 ~ −6	−6 ~ −11	−11 ~ −16
SNR/SNS65	0 ~ −8	−8 ~ −14	−14 ~ −20

Note 1: No symbol is necessary for normal clearance. Add the corresponding symbols to the model number if C0 or C1 clearance is required. See the descriptions for the model number coding.

Model Number Coding

SNR45 LRH 2 QZ SS C0 + 1200L P Z - II [1)]

- II — Number of rails specified as matched sets
- Z — Plate cover
- P — Accuracy grade
- 1200L — LM rail length (mm)
- C0 — Preload
- SS — With end seals on both ends
- QZ — With QZ lubricator
- 2 — Number of blocks on one rail
- LRH — Type of LM block
- SNR45 — Model number

[1)] The symbol "II" indicates the projected mounting design with two parallel LM rails.

Options

A variety of accessories are available for types SNR/SNS.
These can be selected depending on the customer's specification.

Accessories

- 1. Seals
  - End seal (Double seal)
  - Side seal
  - Inner seal
  - LaCS (Laminated contact scrapers)
  - Scraper
- 2. Plate covers
- 3. Bellows
- 4. Covering cap for LM rail mounting hole
- 5. Special jig for removing LM block
- 6. QZ lubricator

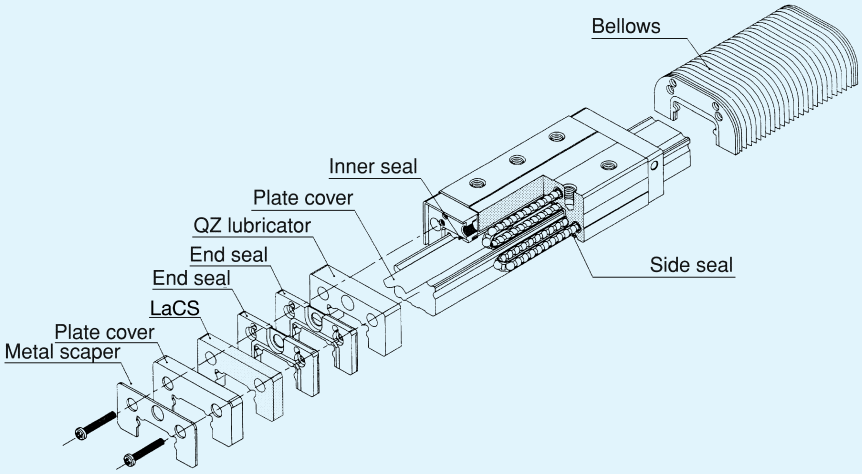

Figure 10 Possible sealings for types SNR and SNS

1. Seal

End Seal

Types SNR/SNS are provided with end seals as a standard feature.

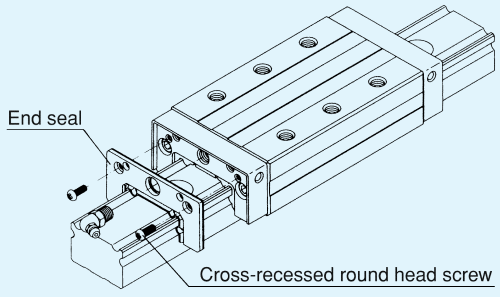

Figure 11

Double seals

Double seals for better contamination protection capability are available for types SNR/SNS.

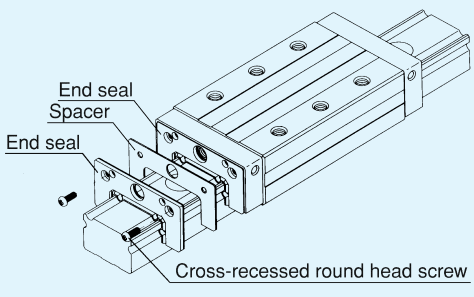

Figure 12

Side seals

To prevent the contamination from under the LM block, side seals are available for types SNR/SNS.

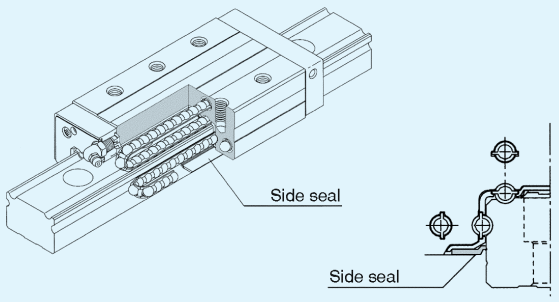

Figure 13

Inner seals

Inner seals to be installed inside the block are available for types SNR/SNS.

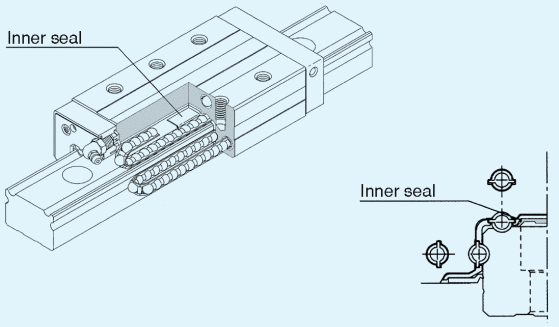

Figure 14

LaCS (Laminated contact scrapers)

The surface-to-surface contact protects the rail from microscopic foreign matter far more effectively than conventional metal scrapers can. Siehe Katalog No. 247-G.

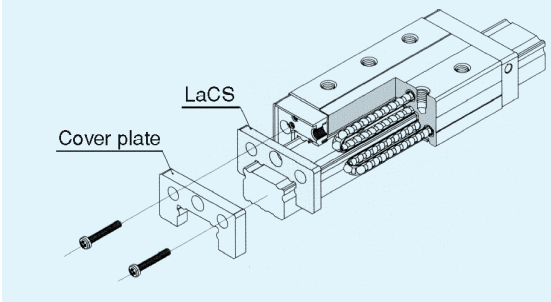

Figure 15

Metal scrapers

Metal scraper is used to remove relatively large or hard particles of foreign matter adhering to the LM rail.

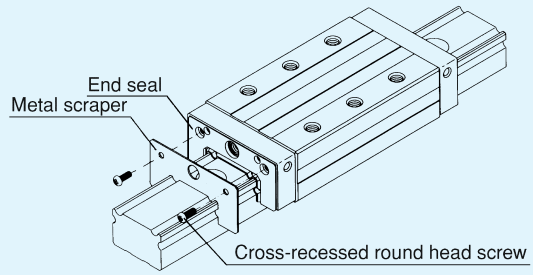

Figure 16

Symbols for contamination protection system

When contamination protection is required, specify according to code shown.

The entire block length may vary depending on the type used. Add the increased dimensions (refer to Table 9) to the corresponding "L" value shown in the dimension tables.

Symbol	Symbol Protection system
UU	With end seal (on both ends)
SS	With end seals, side seals and inner seals
ZZ	With end seals, side seals, inner seals and metal scrapers
DD	With double seals, side seals and inner seals
KK	With double seals, side seals, inner seals and metal scrapers
ZZHH	With end seals, side seals, inner seals, metal scrapers and LaCS
KKHH	With double seals, side seals, inner seals, metal scrapers and LaCS

Table 9 Variation of the LM block length according to the mounted seals Unit: mm

Model No.	—	UU	SS	DD	ZZ	KK	ZZHH	KKHH
SNR/SNS25	—	—	—	7,4	6,2	13,8	22,5	30,5
SNR/SNS30	—	—	—	9,0	6,4	15,4	26,0	35,5
SNR/SNS35	—	—	—	10,2	7,6	17,8	28,0	38,0
SNR/SNS45	—	—	—	10,2	8,4	18,6	32,0	42,5
SNR/SNS55	—	—	—	10,0	8,4	18,6	32,5	42,5
SNR/SNS65	—	—	—	10,6	8,2	18,8	43,5	47,0

2. Plate Covers

Film-thin stainless steel (SUS304) plate covers are available for types SNR/SNS. The plate covers are essential contamination protection devices for machine tools. The plate cover is installed over the rail installation holes and improves the seal contact. It prevents the entry of coolant or machine chips into the block. This cannot be achieved by conventional means. The stopper is used to install the plate cover.

Installing the plate cover:

1. Attach slide pieces to the cover plate. Place the cover plate between a slide piece and a fixing plate, with the slide piece chamfer facing out. Attach the fixing plate to the slide piece using countersunk head screws.

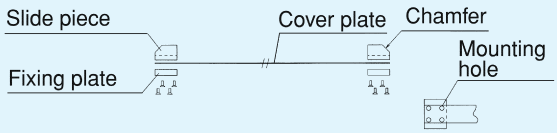

Figure 17

2. Remove the LM block from the LM rail. Mount the fixing jigs to both ends of the LM rail. Locate the positions of the fixing-jig mounting holes and attach the fixing jig using hexagon socket head cap screws.

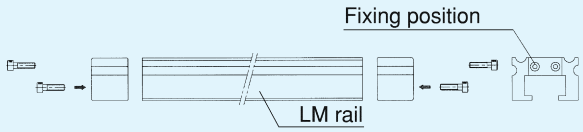

Figure 18

3. Temporarily fix one slide piece.
   Insert one slide piece into the fixing jig. Install it at the end of the LM rail using a tension-adjustment bolt. Screw the bolt in until its head disappears into the fixing jig.

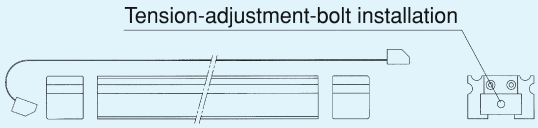

Figure 19

4. Temporarily fix the other slide piece.
   Perform the same steps to temporarily fix the other slide piece.

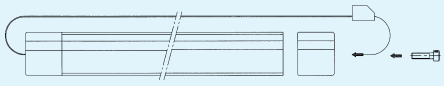

Figure 20

5. Apply tension to the plate cover.
   Tighten the tension-adjustment bolts at both ends of the LM rail so that the tension is well balanced. At this time, care must be taken to ensure that there is no significant difference between the dimension H and the dimension H' illustrated in figure 21, as the tightening margin on one end of the LM rail may be eliminated.

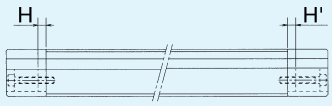

Figure 21

6. Insert the LM block into the LM rail.
   Locate the datum planes of the LM rail and the LM block, and insert the LM block into the LM rail through the use of the insertion jig.

Note:

- 1. When removing or inserting an LM block, be extremely careful not to allow the balls to fall off.
- 2. As the plate cover consists of ultra-thin stainless sheet steel (SUS304), be extremely careful when handling it. Never bend or otherwise deform it.
- 3. Plate covers are not available for both type SNR and type SNS 35 ~ 65.

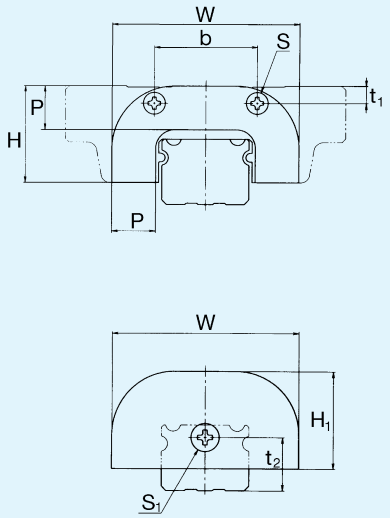
3. Bellows

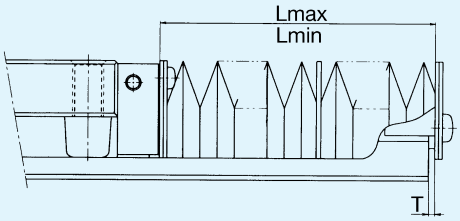
Bellows

Bellows may be installed where coolant or a similar substance is likely to enter.

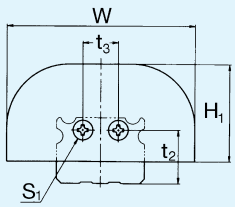
Metal-telescopic cover

A telescopic cover can be installed over the bellows as shown in Figure 22.





SNR/SNS 25 ~ 45



SNR/SNS 55 ~ 65

4. C Cap for LM Rail Mounting Hole

C cap

When chips or foreign materials enter the LM rail mounting holes of the LM Guide, they may enter the LM block. Contaminants can be prevented from entering the LM block by covering those LM rail mounting holes with special caps and ensuring that the caps are flush with the top surface of the LM rail. The special cap type C for LM rail mounting holes is made of a special synthetic resin with a high degree of oilproofing and wear resistance for excellent durability. Special caps for hexagon socket head set screws M5-M16 are kept in stock as standard equipment (Table 11). When it is necessary to order special caps, specify them using the nominal numbers in the dimension table.

To insert a special cap in a mounting hole, apply a flat metal piece to the cap, as shown in Figure 23, and then gently tap the metal until the cap becomes flush with the top of the LM rail.

Table 11 C cap Unit: mm

C cap type	Screw	Main dimensions D	Main dimensions H	Applicable number
C 5	M 5	9,8	2,4	SNR/SNS25
C 6	M 6	11,4	2,7	SNR/SNS30
C 8	M 8	14,4	3,7	SNR/SNS35

C 14	M 14	23,5	5,7	SNR/SNS55
C 16	M 16	26,5	5,7	SNR/SNS65

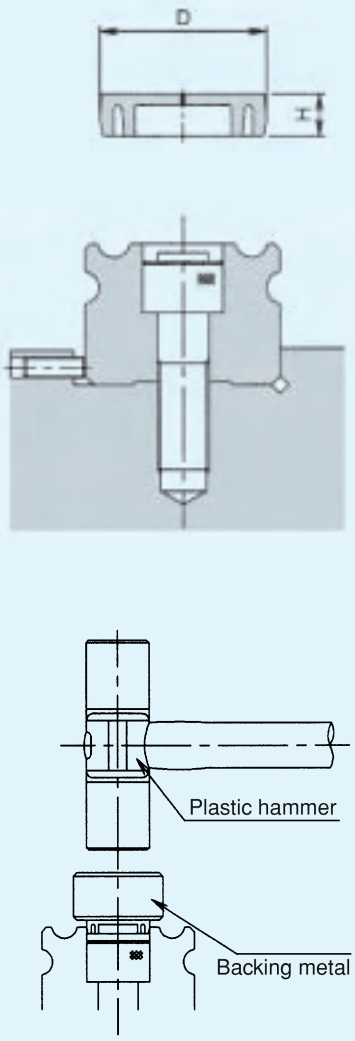

Figure 23

5. Special Insertion Jig

Types SNR/SNS have balls separated by the ball cage. This structure prevents the balls from dropping out when the block is removed from the rail. However, when the block is inserted onto the rail without being properly parallel to the raceway, the ball may drop out or the ball cage may be damaged. We recommend that the special THK insertion jig to be used.

(Always use a special insertion jig for parts to which a preload is applied.)

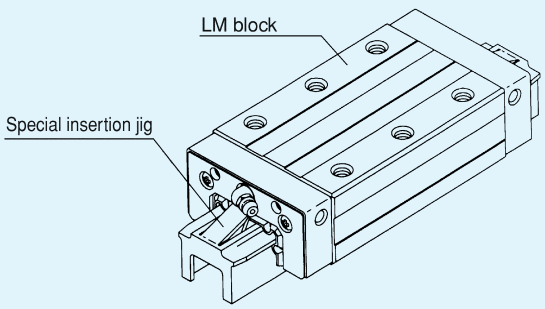

Figure 24

6. QZ Lubricator

THK has developed the QZ lubricator containing a fiber net (occluding element) with high oil content in order to meet the requirement for long-term maintenance-free technology in LM Guide lubrication.

Maintenance intervals can be greatly extended

Normally in LM systems, a (very) small amount of oil is lost as the machine runs. By mounting the QZ lubricator on the LM block, lost oil is automatically replaced, greatly extending maintenance intervals.

QZ lubricator is environmentally conscious

Because QZ lubricator uses a high-density fiber net to supply the appropriate amount of oil to the appropriate positions, there is no excess oil, making it an environmentally conscious design.

The best oil for each application can be used

QZ lubricator permits the use of the most suitable oil for LM Guide. QZ lubricator is available as a standard option for types SNR/SNS.

See THK Catalog No. 230-E for details.

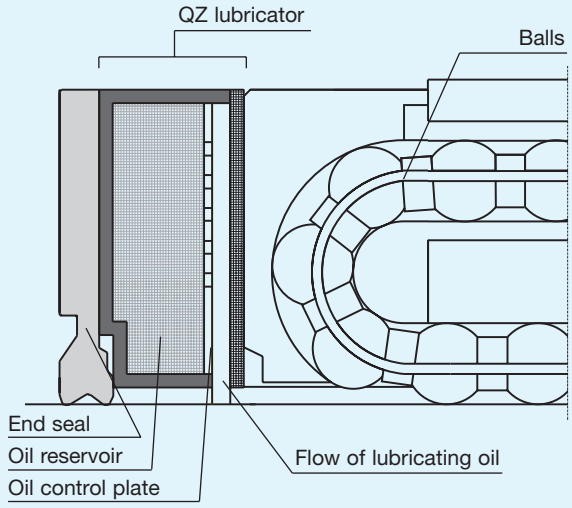

Figure 25

Mounting Instruction

Shoulder height and bottom corner of installation surfaces

For installation, recommended shoulder height is listed in Table 12. Also, bottom corner of shoulder should have relief or radius less than r in table 12.

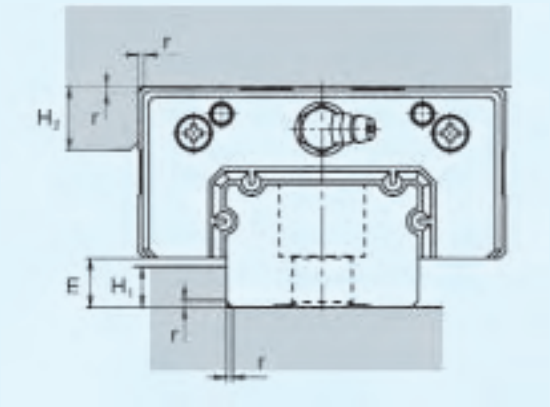

Figure 26

Table 12 Heights and radius of bottom corner Unit: mm

Model number	Radius of bottom corner $r_{(max.)}$	Shoulder height accommodating LM rail H_1	Shoulder height accommodating LM block H_2	E
SNR/SNS25	0,5	5	5	5,5
SNR/SNS30	1,0	5	5	7
SNR/SNS35	1,0	6	6	9
SNR/SNS45	1,0	8	8	11,5
SNR/SNS55	1,5	10	10	14
SNR/SNS65	1,5	10	10	15

Seal Resistance

Regarding to types SNR/ SNS with "SS" seals (end seals and side seals on both ends), Table13 shows the values of maximum seal resistance for one LM block.

Table 13 Seal resistance Unit: N

Model number	Seal resistance

Standard and Maximum Lengths of LM Rails

Table 14 lists the standard and maximum LM rail lengths of types SNR/SNS. If a rail longer than the corresponding maximum length is specified, the rail will be in two or more sections.
If a special length is required, G dimension listed in the table is recommended. If the G dimension is too long, it makes the rail ends insecure which may adversely affect accuracy. When two or more rails are to be connected, be sure to inform THK of the overall LM rail length.

The rails will be machined simultaneously in order to give precise joints.

Figure 27

Table 14 Standard and maximum LM rail lengths of types SNR/SNS Unit: mm

Model number	SNR/SNS25	SNR/SNS30	SNR/SNS35	SNR/SNS45	SNR/SNS55	SNR/SNS65

Notes on use

• Precautions in handling the LM block

The LM block includes precision mold resin. When it is dropped or struck, it may be damaged. Please take great care in handling the LM block.

• Using holes on the sides of the LM block for lubrication nipples

When it is necessary to use holes on the sides of the LM block for attachment of lubrication nipples, please contact THK . THK will install nipples on the LM block. (Holes are not made all the way through to prevent foreign materials from entering.)
These holes are for lubrication nipples only. Use of these holes for other purpose may break end plate.

• Reinstalling the LM block

When the LM block is removed from the LM rail and then reinstalled, please insert it very carefully and correctly.
**For reinstallation, we recommend that a special insertion jig is to be used. Please contact THK upon the use of jig.

• Coolant

When the LM block is used in an environment in which some coolant may enter the LM block, some types of coolant may adversely affect the functions of the LM block. Please contact THK when selecting a coolant.

• Operating temperature range

The LM block is made from special resin. Do not use it above 80°C.

• Lubrication

Ordinary grease may not be utilized when the system is used in a special environment such as an area subject to extremes of temperature or continuous vibration, a clean room, or a vacuum environment. If the system is to be used in a special environment, please contact THK .
